[2] *A Collection of certaine Letters and Conferences, lately passed betwixt certaine Preachers and Two Prisoners in the Fleet* (1590), p. 67. These letters were addressed to the Puritan leaders, and state the radical point of divergence of the two systems. This was the church idea; Greenwood and Barrowe, in all their prison Conferences, which were many, fall back on this idea:—"Christ's church always consisteth of a holy free people, separate from the world, rightly called and gathered unto Christ, walking forth in faith and obedience."

[3] Barrowe, *A Brief Discouerie of the False Church* (1590), p. 33. This is Barrowe's principal work, but he and Greenwood were both prolific and vigorous writers. They had a lengthy controversy with Mr George Gifford, a "Conformable Puritan," who charged them with being the "Donatists of England." They and the Puritans were curiously most deeply at feud. Yet it was only natural. The Puritans were anxious to show that they had no kinship with the Brownists, the Brownists were anxious to drive the Puritans to the logical outcome of their position—separation. Barrowe's first reply to Gifford was the "Plain Refutation, wherein is discovered the Forgery of the whole Ministry; the Confvsion; False Worship; and Anti-Christian Disorder, of these Parish Assemblies called the Church of England" (1591).

[4] *Ibid.*, p. 9.

[5] In 1593, in a debate on a Bill to explain the statute 23d of Eliz. 1580, and for the further reducing "disloyal subjects to obedience," Sir Walter Raleigh declared that there were "as many as twenty thousand" Brownists in England. He was anxious that they should be "rooted out of the commonwealth," but was alarmed lest the law that was needed to do so should turn out to be capable of use against liberal-minded Conformists like himself. See D'Ewes, p. 517, An. 35 Eliz.

altogether nobler spirit, devout, simple-minded, erudite, one who "had not his better for the Hebrew tongue in the university (of Leyden) nor scarce in Europe," anxious only to be allowed to search out the meaning of Scripture and teach it to his people. The church under these two men had a somewhat troubled history, and divided at length, part going with Johnson, part with Ainsworth, the cause of the division being as to the office and power of the elder. The former held that the church had power to elect, but not to depose, the elders, who were its real governors, but the latter held that the elders were responsible to the church, which had the power, as to appoint, so also to depose and excommunicate them. Johnson was moving away from Independency, as it is now understood, but Ainsworth towards it. Their church is significant as an attempt to realize the ideal of Barrowe and Greenwood, a provisional or tentative Independency, but no more.

A much more successful attempt at realizing the Independent ideal was made at Leyden under the leadership of John Robinson (see ROBINSON, JOHN). He and his people came from Scrooby, in Nottinghamshire. Their headquarters had been at first at Gainsborough-on-Trent. In 1606 one section of the church under John Smyth—who was to become the most extreme of separatists, discovering that baptism by a corrupt church was none, to rebaptize himself and become founder of the General Baptists—emigrated to Amsterdam; the other organized themselves under Robinson at Scrooby. But peace was impossible; flight became necessary. So in 1607 and 1608 they succeeded in escaping in detachments to Holland, settling first in Amsterdam, ultimately in Leyden. There the fine qualities of Robinson found a congenial soil, and developed as they could not have done in the less generous air of England. Leyden helped to make English separatism into Independency. What is developed in antagonism is ill developed, full of exaggerations, undue emphases, antitheses so sharply stated as to be almost, even when true, dangerously near the false. A proscribed faith may be strong, but can never be sweet; and the strength that is bitter is not a purely religious strength. So Independency in England in the days of Whitgift and Bancroft was too much hated and hunted to be able to say the best word and do the best thing for itself. But Independency in Leyden,—breathing the free air of the Dutch republic, living in open fellowship with all its institutions, braced by its strong enthusiasm for liberty, its robust religious faith, its brilliant and fruitful intellectual activity, then at its best and brightest in the young university of the city,—was Independency planted where it could do approximate justice to its own ideal. The influence of the changed conditions soon became manifest in its happier spirit. The church at Leyden lost the narrow and ungenerous spirit of separatism, pleaded for the duty of communion with the godly in the Church of England and the other reformed churches. On this point Robinson wrote with eloquence and acted with courage, his spirit growing the larger the longer he lived. While professing "a separation from the English national, provincial, diocesan, and parochial church, and churches, in the whole former state and order thereof," he yet confessed and declared that he had still "the same faith, hope, spirit, baptism, and Lord" as in the Church of England, that he enjoyed fellowship with her "many thousands" of godly sons, and that occasional "hearing of the word of God as there preached" was both lawful and necessary to him as a Christian man.[1] This most generous spirit and conduct involved Robinson in a long and bitter controversy with Helwys and other extreme separatists, who held approval of anything or any one connected with the Anglican Church to be altogether a sin; but it in no way modified the rigour of his Independency. His definition of a church is almost identical with Barrowe's: "A company, consisting though but of two or three, separated from the world, whether unchristian or anti-christian, and gathered into the name of Christ by a covenant made to walk in all the ways of God known unto them, is a church, and so hath the whole power of Christ."[2] Its independence, its sufficiency as a church alike in what concerned idea and reality, he strenuously maintained. Thus "neither was Peter or Paul more one, whole, entire, and perfect man, consisting of their parts essential and integral, without relation unto other men, than is a particular congregation, rightly instituted and ordered, a whole, entire, and perfect church immediately and independently, in respect of other churches, under Christ."[3] Above a church so conceived there could be no authoritative person or court, ecclesiastical or civil; it was armed with all the powers necessary to do the will of its Head, and to interfere with it was an unlawful interference with rights it had received from Him. Office did not exalt a man above the brotherhood; the clergy were but Christians, and good only as Christians. To saintship, and not to office, was promised the forgiveness of sins. "The estate of a saint is most happy and blessed, though the person never so much as come near an office; but, on the contrary, an officer, if he be not also and first a saint, is a most wretched and accursed creature."[4] Acts to be acts of the church must be collective, done, not by the clergy or the officers only, but by the brethren as well.[5] The church was, indeed, an ecclesia, an assembly, called out and called together by the public preaching of the word, but forming in its collective and corporate character a body possessed of supreme authority, of all the attributes, rights, and prerogatives that belong to those who rule. It is evident that a conception of this kind was full of promise. It showed a firm trust in the capabilities of individual Christian men to exercise the rights of citizenship within the kingdom of God. It made it in the highest degree wrong for any ruler or body of rulers to enforce their own belief on the people. And it was as opposed to ecclesiastical as to civil tyranny, whether in its Episcopal or Presbyterial form. Robinson, indeed, was far from seeing or courageously deducing all the consequences implied in his Independency. He was even illogical enough to state, though in a hesitating way, principles radically incompatible with it. He concedes "that godly magistrates are by compulsion to repress public and notable idolatry," by some penalty "to provoke their subjects universally unto hearing for their instruction and conversion"; but he denies that any king is at liberty to inflict death upon all that refuse to be drawn into covenant with God, or remain wicked and unrepentant.[6] He knows well enough the utmost coercion can do. "By this course of compulsion many become atheists, hypocrites, and familists, and, being at first constrained to practise against conscience, lose all conscience afterwards." Liberty is too complex a notion to be easily and in all its bearings grasped; and liberty in religion too great a thing to be suddenly and all at once understood and realized.

The Leyden church is the parent of Independency alike in England and America. In 1616 Henry Jacob, a native of Kent, a graduate of Oxford, one of Johnson's converts, pastor awhile of a church at Middleburg, then a resident with Robinson at Leyden, returned to England, and founded an Independent church at Southwark. In 1620 a little company led by Elder Brewster and Deacon Carver sailed from Delfthaven, landed in the midst of a severe and stormy

winter on the North American coast, and there laid the foundations of the New England States, with all they were to be and to create. Jacob had been all through his exile anxiously looking towards England. In 1609 he had addressed to King James "An Humble Supplication for Toleration,"[1] in which he begs that "each particular church may be allowed to partake in the benefit of the said toleration, may have, enjoy, and put in execution and practice this her right and privilege," viz., "to elect, ordain, and deprive her own ministers, and to exercise all the other points of lawful ecclesiastical jurisdiction under Christ." This may be regarded as a clear and explicit statement of the early Independent position, its claim for toleration based on its conception of the Christian church, its plea for liberty of worship based on its principle of individualism and the rights of the individual conscience. With what was here asked it would at any time in the 17th century have been satisfied, but the Anglican policy of Elizabeth, and James, and Charles I. proceeded on this principle, that to allow diversity was to destroy unity, to permit the growth of elements that would prove fatal to the church, involve the denial of the royal authority and the break-up of the state. Yet the very severity of the Anglican policy strengthened Independency. It helped to identify the struggle for liberty of conscience with the struggle for English liberty.

Up to 1640 little formal progress was made. Churches did not multiply; Laud was too active, and the Star Chamber too vigorous. But the real progress was immense. Statesmen were persuaded that a system which required so harsh a policy could not be right. Religious men who could not conform went to live in lands and under laws where obedience to conscience was possible. There was a double emigration, to the Continent and to New England. In Arnheim, Thomas Goodwin and Philip Nye ministered to a small congregation; in Rotterdam, Hugh Peters and William Ames, the most skilled, scholastic, and disputatious theologian of the early Independents, who came from his professorial chair at Franeker in 1632 to die at Rotterdam a year later. Here, too, when Ames was dead and Peters gone to New England, came Jeremiah Burroughs, William Bridge, and Sidrach Simpson, all of them names that were to be conspicuous and influential in days to come.

But the emigration to New England was much the more important alike as regards its influence on Independency and English history. It has been calculated that in the period 1620–1640 upwards of 22,000 Puritan emigrants (the figures have been placed as high as 50,000) sailed from English and Dutch ports. The reasons that compelled their departure determined their quality; they were all men of rigorous consciences, who loved their fatherland much, but religion more, not driven from home by mercantile necessities or ambitions, but solely by their determination to be free to worship God. They were, as Milton said,[2] "faithful and freeborn Englishmen and good Christians constrained to forsake their dearest home, their friends, and kindred, whom nothing but the wide ocean and the savage deserts of America could hide and shelter from the fury of the bishops." Men so moved so to act could hardly be commonplace; and so among them we find characters strong and marked, with equal ability to rule and to obey, as Bradford and Brewster, Winslow and Standish, Winthrop and Dr Samuel Fuller, and men so inflexible in their love of liberty and faith in man as Roger Williams and young Harry Vane. And as were the people so were their ministers. Of these it is enough to name John Cotton, able both as a divine and as a statesman, potent in England by his expositions and apologies of the "New England way," potent in America for his organizing and administrative power; Thomas Hooker, also famed as an exponent and apologist of the "New England way," whose book was commended to theologians at home by Thomas Goodwin, and whose early death was lamented by Cotton in lines which told how

> "Zion's beauty did most clearly shine
> In Hooker's rule and doctrine, both divine;"

John Eliot, famous as the "apostle of the Indians," first of Protestant missionaries to the heathen; Richard Mather, whose influence and work were carried on by his distinguished son, and his still more distinguished grandson, Cotton Mather. The motives and circumstances of the emigrants determined their polity; they went out as churches and settled as church states. They were all Puritans, but not all Independents—indeed, at first only the men from Leyden were, and they were throughout more enlightened and tolerant than the men of the other settlements. Winthrop's company were noncomformists but not separatists, esteemed it "an honour to call the Church of England, from whence we rise, our dear mother," emigrated that they might be divided from her corruptions, not from herself.[3] But the new conditions, backed by the special influence of the Plymouth settlement, were too much for them; they became Independent,—first, perhaps, of necessity, then of conviction and choice. Only so could they guard their ecclesiastical and their civil liberties. These, indeed, were at first formally as well as really identical. In 1631 the general court of the Massachusetts colony resolved, "that no man shall be admitted to the freedom of this body politic, but such as are members of some of the churches within the limits of the same."[4] Church and state, citizenship in the one and membership in the other, thus became identical, and the foundation was laid for those troubles and consequent severities that vexed and shamed the early history of Independency in New England, natural enough when all their circumstances are fairly considered, indefensible when we regard their idea of the relation of the civil power to the conscience and religion, but explicable when their church idea alone is regarded. And this latter was their own standpoint; their acts were more acts of church discipline than those of civil penalty.

Meanwhile, the growth of the New England States and their Independency in religion exercised extraordinary influence in England. It encouraged the Puritans, opened to them a refuge from the Anglican tyranny, showed them an English state where the bishop had ceased to trouble and where their own principles were active and realized. Laud thoroughly comprehended the situation, saw that Independency in the colonies must be struck down if Anglican policy was to succeed at home. They were a

[1] *An Humble Supplication for Toleration, and Liberty to enjoy and observe the Ordinances of Jesus Christ in the Administration of his Churches in lieu of Human Constitutions* (1609; no place or printer). In the following year Jacob published a work on *The Divine Beginning and Institution of Christ's true Visible or Ministerial Church*; and in 1612 a sequel to the above, *A Declaration and Plainer Opening of certain Points* (published at Middleburg). This latter is remarkable as containing the earliest use, in the ecclesiastical sense, of the word "Independent." "Where each ordinary congregation giveth their free consent in their own government, there certainly each is an entire and independent body-politic, and endued with power immediately under and from Christ, as every proper Church is, and ought to be," p. 13. It is interesting to note that the above *Supplication* is the earliest plea for toleration in the English language, but a few years later appeared a much more thoroughgoing work, *Religious Peace, or a Plea for Liberty of Conscience* (1614). This was by Leonard Busher, a Baptist, and to this body belongs the honour of being the first to develop the liberty implied in Independency. See Busher's and other tracts on "Liberty of Conscience" in publications of Hanserd Knollys Society.

receptacle for schismatics, "from whence, as from the bowels of the Trojan horse, so many incendiaries might break out to inflame the nation;" and so it would be necessary to send them a bishop "for their better government, and back him with some forces to compel, if he were not otherwise able to persuade, obedience."[1] But home politics alone were too much for Laud; and on his downfall and the outbreak of the civil war New England Independency became, on account of its influence on the ecclesiastico-political question, still more potent in English affairs. The Independent party in the Westminster Assembly—which had been called to advise parliament—was small, but influential. Its ministerial members were Thomas Goodwin, a ponderous but learned and conscientious man; Philip Nye, a skilful debater and adroit man of business; Jeremiah Burroughs, a man of sweet manners and gentle disposition, but great prudence and firmness; William Bridge, and Sidrach Simpson. These were all marked by conspicuous moderation of view, but the lay members, like Lord Saye and Sele and Sir Harry Vane, were more advanced, especially on the cardinal question of toleration. The importance of the New England States was at once recognized by the parliamentary Independents, who made an effort to bring over their three most eminent ministers, John Cotton, John Davenport, and Thomas Hooker. The effort failed; but in place of the men books and pamphlets, expository and defensive of the "New England way," were discharged in quick succession upon the English public. What gave New England its importance was this—it was the first realization on a large scale of the principles of Independency. Here they had been tried under most difficult conditions, and had proved thoroughly successful, capable of maintaining order in the churches, religion in the state, purity of doctrine, and efficiency of discipline. What Geneva had been to the Puritans under Elizabeth New England was now to the Independents—it was their religious ideal realized, their polity commended by an illustrious example. They were no longer, as in the days of John Robinson or Henry Jacob, the apologists of an unpopular and strange theory, hitherto unrealized save on a scale and under conditions that made it ridiculous, charged with all the evils that could be proved logically certain to follow from it. On the contrary, they had now behind them the church-state beyond the ocean, and they could proudly tell how men of English blood, who had fled from the Anglican oppression, had tried Independency and prevailed. So there was the amplest controversy on the points at issue, the Scotch divines being specially active on the one side, and American divines, prefaced and introduced and explained by English, on the other. The controversy did something to lessen the distance between Presbyterians and Independents, and did much to strengthen the position of the latter in England. It showed that independence did not mean isolation, that churches that refused to be organized into a political unity still constituted a Christian brotherhood, that societies that were so jealous of their freedom and rights as to deny to every external authority judicial and legislative functions could yet seek and follow fraternal advice, and meet in common councils to advise and be advised. But the Westminster Assembly and the English Parliament did not approve the "New England way," and the Independents had to be contented to plead for toleration. This, indeed, became their great demand—the point on which they and the Presbyterians differed radically. Here the Presbyterians were inflexible. Toleration was to them the very man of sin. But to the Independents it was the very condition of continued existence. Without it England would be no better for them under Presbytery than it had been under Episcopacy. As to the nature and degree of this toleration, they were divided into two sections, one moderate, the other more advanced. To the former belonged the ministerial members of the assembly, who wished only a limited toleration. They did not desire all views to be tolerated, but only the views of good men, men of pious, tender consciences, not those of infidels or blasphemers. But the more advanced section courageously advocated absolute toleration, denied that so long as a man was a peaceable citizen the magistrate had any right to interfere with his conscience or conscientious beliefs. To this section belonged Harry Vane, Henry Burton, John Goodwin of Coleman Street, ablest and most restless of controversialists in that controversial age; Roger Williams, now a Baptist, but still an Independent, home from America, bringing with him the MS. of a great book on this very subject; finally, above all, John Milton. These were the advanced guard, and theirs was the section that made Independency so immense a political power in the England of the Commonwealth.

This is not the place to inquire into the causes of the sudden and extraordinary ascendency of the Independents in the time of the Commonwealth. Enough to say, it was due to causes both political and religious—to what may be termed the transmutation of a great religious into a great political question. The men Independency formed and forced to the front were remarkable men, strong of will, clear of eye, mighty through faith in their principles. And their principles were precisely of the kind suited to the emergency, republican and revolutionary, but steeped in the commanding emotions and enthusiasms of religion. They were principles that ennobled man, that asserted the rights of the individual, that made it an easy matter to deal with the divine rights of kings, or kings too assertive of their rights and forgetful of their duties. So the Independents had the incalculable advantage of always seeing clearly before them, knowing their end and never being in any doubt about the way to it. Besides, their theory of the church fell in with the spirit of the Commonwealth. It made but small distinction between clergy and laity, and the man with the gift of speech could easily exercise it in preaching. So the army when new modelled, formed of men of spirit and conviction, became quite a nursery of Independents, and men like Richard Baxter found that in it there were quite as many ready to edify as wishful to be edified. Religion thus became, not a matter for the clergy, but the possession of the people, not simply the concern of the church, but the business of the whole nation. There was considerable diversity in theological opinion. The moderate men were Calvinists, but among the extreme men were Arminians, like John Goodwin, and men as yet of no recognized school, like John Milton. Independency, in short, meant the equal concern of every man in religion, alike in its deepest mysteries and most practical precepts; and so in a period of religious enthusiasm and ferment it naturally came to the front and took the lead. But the extent of its power under the Commonwealth was the measure of the disfavour that came to it after the Restoration. The Presbyterians had been mainly instrumental in the bringing back of Charles, and so it had been indecent had no attempt been made to comprehend them within the church. But in the case of the Independents there was not even an abortive attempt at comprehension. And they did not ask what they knew they would not receive. They only wished to be tolerated, to be allowed to live, and no more. At first they thought that this might be. Philip Nye had seen the king, and was hopeful. But their illusions were soon dispelled. In 1661 the Corporation Act was passed, which disqualified Nonconformists for municipal offices; in 1662 the Act of Uniformity, which drove upwards of two thousand ministers out of the church, and

[1] Heylyn, *Life of Laud*, p. 369.

silenced all who did not conform; in 1663 the Conventicle Act, which prevented Nonconformist congregations meeting, not allowing in houses more than five persons beyond the family to be present at once. In 1665 the Five Mile Act forbade non-conforming ministers to come within 5 miles of any corporate borough; in 1670 the Conventicle Act was made more rigorous; and in 1673 the Test Act made Nonconformists ineligible for offices, civil, naval, or military, under the crown. Charles, indeed, in his weak way, tried to be more generous than his church or parliament, wished to tolerate the Nonconformists that he might the better tolerate the Roman Catholics. Out of this feeling came the Declaration of Indulgence in 1672,—which was, incidentally, the means of proving the strength of dissent, three thousand applications being made for licences to use or erect places of worship; but parliament resisted, and Charles gave way.

In the dark days that had now come to them, the Independents, it may well be said, lived with patient courage, and learned through their sufferings. They had men among them that adorned their adversity, and made even their sudden obscurity illustrious. John Owen, late vice-chancellor of Oxford, massive, erudite, the ideal of the scholastic theologian, building up with patient skill his loved science and fencing it round with the sort of arguments his age understood; Thomas Goodwin, less varied but more subtle, not so broad but quite as analytic as Owen, dealing with rich delight in the dialectical subtleties that pleased his age; John Howe, with a soul above the narrowness and bitterness of his day, serene in the midst of his troubles, living in sublime contemplation on "the Living Temple," or the "Vision of God"; Joseph Caryl and William Greenhill, quaint expositors, rich in the lore then used to explain the Old Testament; Theophilus Gale, the equal of Cudworth in his knowledge of the ancient world, full of the great and fruitful idea he has embodied in his *Court of the Gentiles*,—these were some of the ejected from church or university, and they may help to show the quality of the men who were now, because of their Independency, outcasts from the Church of England, and for it deprived of their common rights as citizens. Their conduct under James showed that they would not purchase their own privileges at the expense of the public safety, and under William their fidelity to the constitution and liberties of England had its first reward in the Act of Toleration. This was but a small concession, and one that by the Occasional Conformity Act of Anne was almost as good as repealed. But what had been done could not be altogether undone. The coming in of the Hanoverian dynasty brought a more liberal spirit into politics, and history has ever since, with an occasional period of declension, been a progressive movement towards freedom. As one by one its principles and claims have been admitted by the state, England has become a roomier and healthier place for spirits who feel that for religion to be religious it must be free.

In estimating the work done in England by the Independents, it is necessary to bear in mind the extent to which they have supplemented the deficiencies of the Anglican Church. But for them religion in many places would have almost, perhaps altogether, died out. They have helped to quicken and deepen the religious consciousness and life of the English people. Their preachers, too, have not been without influence, which is the more remarkable as from the time of the Act of Uniformity till a few years ago they were excluded from the national universities. Soon after the passing of the Act of Toleration we find Independent preachers rising to eminence. The Foster who was celebrated in Pope's couplet—

> "Let modest Foster, if he will, excel
> Ten metropolitans in preaching well—

was an Independent, and as vigorous as a thinker as he was eloquent as a preacher, his answer to Tindal anticipating in its leading lines the celebrated argument of Butler in his *Analogy*. Isaac Watts is a name that must still be honoured, and Philip Doddridge a name that must be mentioned with respect. Edward Williams did much to revive the study of theology in the end of last century and early years of this, and Dr Pye Smith showed that within dissent scholarship and theological learning were still possible. The last generation had not a few men of distinction. The names of Henry Rogers, Joseph Gilbert, J. Angell James, Dr Winter Hamilton, Dr Ralph Wardlaw, Dr Robert Vaughan, his distinguished son Alfred Vaughan, Dr Halley, the historian of Nonconformity in Lancashire, and Thomas Binney of London are names representative of the kind of men that Independency can still produce.

But to complete this sketch of the Independents we must add one other element—the work done by their academies and colleges. They have always believed in an educated ministry, and when cast out of the universities one of their very first acts was to found academies. These they had great difficulty in maintaining, because of the operation of the oppressive acts passed in Charles II.'s reign; but in spite of the difficulties they contrived to do so. Theophilus Gale had an academy; so had Samuel Cradock, Thomas Doolittle, Richard Frankland, and others of the ejected ministers. It was possible to keep these only by the most frequent changes of place, so as to elude the vigilance of the authorities. When toleration was granted, the academies were able in the greater quiet they now enjoyed to do better work. One of these may serve as a sample. At Gloucester and then at Tewkesbury was an academy conducted by the Rev. Samuel Jones. Here were educated Thomas Secker, afterwards archbishop of Canterbury; Joseph Butler, bishop of Durham, and author of the *Analogy*; Samuel Chandler, one of the finest scholars of his day, who remained in poverty the scholar and the Christian Nonconformist still; and Jeremiah Jones. We know, on the authority of an early letter of Secker's, the method of education followed in Tewkesbury; and certainly, measured by the standard of the day, it was as thorough as the education was ample. Out of these academies the present Congregational colleges have grown.

It is unnecessary to attempt any exposition of the principles of Independency. These have been made apparent in the progress of this sketch. It may simply be said here that the Independents conceive their church order as the primitive and apostolic, and that out of their idea of the constitution and order of the primitive Christian churches their own system has grown. They believe that their conception of the church necessarily involves freedom of conscience, the interference with no man's belief, the concession of equal rights to all churches or religious societies by the state, and they may well remember with pride that John Locke based his plea for toleration on a conception of the church essentially akin to theirs.[1] Their notion of the pastoral office is in no respect sacerdotal, but is based on the Old Testament idea of the prophet, on the New Testament idea of the preacher—the man who by help or inspiration of God speaks for God to men. And the call to his office comes through the people; the divine choice is expressed through the men the divine word enlightens and the divine Spirit guides. Their theology has been predominantly Calvinistic, though of the more moderate type; but there has always been variety of theological opinion, subscription and the uniformity it attempts to secure being alike impossible to Independency.

[1] *Works*, ii. 245 (ed. 1759).

For statistics of the denomination and the reasons which have induced it to assume the name Congregationalist, see CONGREGATIONALISM.

INDEX is a word that may be understood either specially as a table of references to a book or, more generally, as an indicator of the position of required information on any given subject. According to classical usage, the Latin word *index* denoted a discoverer, discloser, or informer; a catalogue or list; an inscription; the title of a book; and the fore or index-finger. Cicero also used the word to express the table of contents to a book, and explained his meaning by the Greek form *syllabus*. Shakespeare uses the word with the general meaning of a table of contents or preface—thus Nestor says (*Troilus and Cressida*, i. 3)—

> "And in such indexes, although small pricks
> To their subsequent volumes, there is seen
> The baby figure of the giant mass."

Table was the usual English word, and index was not thoroughly naturalized until the beginning of the 17th century, and even then it was usual to explain it as "index or table." By the present English usage, according to which the word table is reserved for the summary of the contents as they occur in a book, and the word index for the arranged analysis of the contents, we obtain an advantage not enjoyed in other languages, for the French *table* is used for both kinds, as is *indice* in Italian and Spanish. There is a group of words each of which has its distinct meaning but finds its respective place under the general heading of index work; these are calendar, catalogue, digest, inventory, register, summary, syllabus, and table.[1] The value of indexes was recognized in the earliest times, and many old books have full and admirably constructed ones. A good index has sometimes kept a dull book alive by reason of the value or amusing character of its contents. Mr Carlyle refers to Prynne's *Histrio-Mastix* as "a book still extant, but never more to be read by mortal;" but the index must have given amusement to many from the curious character of its entries, and Attorney-General Noy particularly alluded to it in his speech at Prynne's trial. Indexes have sometimes been used as vehicles of satire, and the witty Dr William King was the first to use them as a weapon of attack. His earliest essay in this field was the index added to the second edition of the Hon. Charles Boyle's attack upon Bentley's *Dissertation on the Epistles of Phalaris*, 1698.

[1] Another old word occasionally used in the sense of an index is "pye." The late Sir T. Duffus Hardy, in some observations on the derivation of the word "Pye-Book" (which most probably comes from the Latin *pica*), remarks that the earliest use he had noted of pye in this sense is dated 1547—"a Pye of all the names of such Balives as been to accompte pro anno regni regis Edwardi Sexti primo."

To serve its purpose well, an index must be compiled with care, the references being placed under the heading that the reader is most likely to seek. An index should be one and indivisible, and not broken up into several alphabets; thus every work, whether in one or more volumes, ought to have its complete index. This important rule has been often neglected in English books, and is almost universally rejected in foreign ones, to the great inconvenience of readers. The mode of arrangement calls for special attention; this may be either chronological, alphabetical, or according to classes, but great confusion will be caused by uniting the three systems. The alphabetical arrangement is so simple, convenient, and easily understood that it has naturally superseded the other forms, save in some exceptional cases. Much of the value of an index depends upon the mode in which it is printed, and every endeavour should be made to set it out with clearness. In old indexes the indexed word was not brought to the front, but was left in its place in the sentence, so that the alphabetical order was not made perceptible to the eye. There are few points in which the printer is more likely to go wrong than in the use of marks of repetition, and many otherwise good indexes are full of the most perplexing cases of misapplication in this respect. The oft-quoted instance—

> Mill on Liberty
> —— on the Floss

actually occurred in a catalogue. There appears now to be a revived interest in indexes, and as books daily increase the need of some satisfactory digest of information becomes more keenly felt. In 1877 the Index Society was formed with the object of making and printing indexes of books unprovided with them, of compiling and printing indexes of particular subjects, and of gradually preparing a universal index for reference. In order to obtain uniformity in the compilation of indexes a series of rules for indexing have been drawn up by the society. Several publications have already been issued to the subscribers.

The following is a list of some of the most important indexes, both of words and of subjects. The chief indexes of words are dictionaries, but these are a special class by themselves. Next come concordances: the first one to the Bible was compiled by Hugo of St Cher in 1247, the first English concordance to the New Testament was published in 1536, and to the whole Bible in 1550, compiled by John Marbeck. Other Biblical concordances are those of R. F. Hervey, 1579; C. Cotton, 1622 (frequently reprinted); J. Downame, 1632; R. Wickens, 1655; S. Newman, 1650, 3d ed. 1682; A. Cruden, 1737 (this superseded all works of the same character); and R. Young, 1880. The following concordances may also be mentioned:—to the Psalter, 1834; to the Prayer Book, 1851; to the *Iliad*, by G. L. Prendergast, 1875, to Shakespeare, by S. Ayscough (1790), by F. Twiss (1805), by Mrs Cowden Clarke (1845), by J. O. Halliwell (*Handbook Index*, 1866), and by A. Schmidt (1874), and to Shakespeare's *Poems*, by Mrs H. H. Furness, 1874; to Milton's *Paradise Lost* (1741), and to his *Poetical Works*, by H. J. Todd (1809), by G. L. Prendergast (1857), and by C. D. Cleveland (1867); to Pope's *Works*, by E. Abbott, 1875; to Tennyson's *Works*, by D. B. Brightwell, 1869, and another published by Strahan, 1870; to *In Memoriam* (1862); to Keble's *Christian Year*, 1871; and to Watts's *Psalms*, by D. Guy, 1774. A large number of historical works have been supplied with indexes in separate volumes. Among the more important indexes of prose writers are those of the works of Samuel Richardson (1755), Joanna Southcott (n. d., and 1815), John Strype (1828), and T. Carlyle (1874); *The Wellington Despatches* (1839); Wesley's *Journals* (1872). A large number of series of publications of societies and of periodicals have been supplied with general indexes.

The Indexes to the Statutes and to the Journals of the Houses of Parliament are perhaps the most elaborate works of the kind ever published. In 1778 a sum of £12,900 was voted for indexes to the Journals of the House of Commons. Few parliamentary papers are issued without a satisfactory index being added. Most of the indexes mentioned above refer to particular books, but in 1848 Mr W. F. Poole published in New York an index to subjects treated in reviews and other periodicals; a second edition was published in 1853 as *An Index to Periodical Literature*. A greatly enlarged edition is now in preparation with the co-operation of English and American librarians. A larger work of a similar character for scientific literature, but arranged under authors' names instead of subjects has been compiled by the Royal Society and is entitled *Catalogue of Scientific Papers* (1800-73), 8 vols. 4to, 1867–1879. (H. B. W.*)

INDEX LIBRORUM PROHIBITORUM is the title borne by the official list of those books which on doctrinal or moral grounds the Roman Catholic Church, under penalty of ecclesiastical censures, authoritatively forbids the members of her communion to possess or to read. Most Governments, whether civil or ecclesiastical, have at all times in one way or another acted on the general principle that some control may and ought to be exercised over the literature circulated among those under their jurisdiction; for various examples, both in ancient and in modern times, reference may be made to the article BIBLIOGRAPHY (vol. iii. p. 658). The earliest known instance of a list of proscribed books being issued with the authority of a bishop of Rome is sometimes assigned to the pontificate of Gelasius (494) and sometimes to that of Hormisdas (514), but most probably ought not to be dated earlier than the 8th century. The document is for the most part, as its name implies, a *Notitia Librorum Apocryphorum qui non recipiuntur*, and chiefly consists of an enumeration of such apocryphal works as by their titles might be apt to mislead the unwary into attaching an undue weight to their teaching (the "Acts" of Philip, Thomas, Peter, Philip, and the Gospels of Thaddæus, Matthias, Peter, James the Less, and others). Its concluding paragraph, however, sweepingly declares all the writings of Simon Magus and of many other heretics who are mentioned by name, as also of many more whose names have been completely forgotten (*minime retinentur*), to be repudiated, eliminated entirely from the Roman Catholic and Apostolic Church, and eternally condemned.[1] Subsequent pontiffs continued to exhort the episcopate and the whole body of the faithful to be on their guard against heretical writings, whether old or new; and one of the functions of the Inquisition when it was established was to exercise a rigid censorship over books put in circulation. The bishops in their dioceses had always, however, a considerable discretion. With the discovery of the art of printing, and the wide and cheap diffusion of all sorts of books which ensued, the need for new precautions against heresy and immorality in literature made itself felt, and more than one pope (Sixtus IV. in 1479 and Alexander VI. in 1501) gave special direction to the archbishops of Cologne, Mainz, Treves, and Magdeburg regarding the growing abuses of the printing press; in 1515 the Lateran council formulated the decree *De Impressione Librorum*, which required that no work should be printed without previous examination by the proper ecclesiastical authority, the penalty of unlicensed printing being excommunication of the culprit, and confiscation and destruction of the books. The council of Trent in its fourth session, 8th April 1546, forbade the sale or possession of any anonymous religious book which had not previously been seen and approved by the ordinary; in the same year the university of Louvain, at the command of Charles V., prepared an "Index" of pernicious and forbidden books, a second edition of which appeared in 1550. In 1557, and again in 1559, Pope Paul IV., through the Inquisition at Rome, published what may be regarded as the first Roman *Index* in the modern ecclesiastical use of that term (*Index auctorum et librorum qui tanquam hæretici aut suspecti aut perversi ab Officio S. R. Inquisitionis reprobantur et in universa Christiana republica interdicuntur*). All anonymous works published since 1519 were condemned without exception in this Index, which directed its hostility chiefly against works that seemed unfavourable to the claims of the Roman curia, or maintained the superiority of councils over popes. A list of sixty-two printers of heretical books was appended. At the 18th session of the council of Trent (26th February 1562), in consideration of the great increase in the number of suspect and pernicious books, and also of the inefficacy of the many previous "censures" which had proceeded from the provinces and from Rome itself, certain fathers were appointed to enquire into these "censures," and to consider what ought to be done in the circumstances. At the 25th session (4th December 1563) this committee of the council was reported to have completed its work, but as the subject did not seem (on account of the great number and variety of the books) to admit of being properly discussed by the council, the result of its labours was handed over to the pope (Pius IV.) to deal with as he should think proper. In the following March accordingly were published, with papal approval, the *Index librorum prohibitorum*, which continues to be reprinted and brought down to date, and the "Ten Rules" which, supplemented and explained by Clement VIII., Sixtus V., Alexander VII., and finally by Benedict XIV. (10th July 1753), still regulate the preparation of that catalogue. By the first of these rules the condemnation of all books already condemned by pope or council prior to 1515 is renewed; by the second the works of "heresiarchs" (Luther, Zwingli, Calvin, Schwenkfeld, Hübmaier) are condemned whatever be their subject, but it is provided that the non-religious works of those who are heretics merely may on examination and approval be permitted; the third and fourth relate to translations of the Bible; the fifth orders the expurgation of lexicons, concordances, and similar compilations by heretics; the sixth discourages the circulation of books in the vulgar tongue about controversies between Catholics and heretics; the seventh, eighth, and ninth relate to obscene or grossly superstitious publications; the tenth contains various details of procedure about the licensing of books, and concludes with the declaration that the possessor or reader of heretical books is forthwith to be excommunicated, while the possessor or reader of books prohibited on other grounds falls into mortal sin, and is to be dealt with severely at the discretion of the bishop. The business of correcting the Index to date is now in the hands of an ecclesiastical board known as the "Congregation of the Index," which consists of a prefect (who is always a cardinal) and other cardinals, with whom are associated the "consulters" and "examiners of books" (*qualificatores*). The *Index Librorum Expurgandorum* or *Expurgatorius* catalogues the works which may be read after the deletion of specified passages. Bishops have the power of granting at their discretion the right to read forbidden books, except in some reserved cases, where the papal dispensation is required. The Roman Index is unfortunately very far from being an exhaustive catalogue of works inconsistent with Catholic orthodoxy, and thus lacks the interest and vast importance it would otherwise have had for the bibliographer.

The early Reformers, by their attitude towards writings which from their point of view seemed objectionable, furnished many an *argumentum ad hominem* to the Catholics (see Gretser's learned work, *De Jure et More prohibendi, expurgandi, et abolendi libros hæreticos et noxios*, 1603); thus we find Calvin writing to the ministers at Frankfort about one of the books of Servetus, with a view to its being burnt (*Ep.* 153). Gradually, however, all the Protestant churches have recognized the expediency of leaving individuals and communities practically free to select for their instruction and amusement the works which in the conscientious exercise of their own responsible judgment they may find best adapted to their wants.

[1] Hardouin, *Conc.*, ii. 940; Labbé, *Conc.*, ii. 938-941. The whole document has also been reprinted in Smith's *Dict. of Chr. Antiq.*, art. "Prohibited Books."

INDIA

INDIA is a great empire of Asia, composed of twelve provinces under direct British administration, and about one hundred and fifty feudatory states and principalities, which equally with the British provinces acknowledge the paramount sovereignty of the British crown. The whole empire contains close on $1\frac{1}{2}$ million square miles, and 240 millions of inhabitants. The area, therefore, is almost equal to, and the population is just equal to, the area and population of all Europe, less Russia. The people exactly double Gibbon's estimate of 120 millions for all the races and nations which obeyed Imperial Rome.

The Name.—The natives of India can scarcely be said to have a word of their own by which to express their common country. In Sanskrit, it would be called "Bhárata-varsha," from Bharata, a legendary monarch of the Lunar line; but Sanskrit is no more the vernacular of India than Latin is of Europe. The name "Hindustán," which was at one time adopted by European geographers, is of Persian origin, meaning "the land of the Hindus," as Afghánistán means "the land of the Afgháns." According to native usage, however, "Hindustán" is limited either to that portion of the peninsula lying north of the Vindhyá mountains, or yet more strictly to the upper basin of the Ganges where Hindí is the spoken language. The "East Indies," as opposed to the "West Indies," is an old-fashioned and inaccurate phrase, dating from the dawn of maritime discovery, and still lingering in certain parliamentary papers. "India," the abstract form of a word derived through the Greeks from the Persicized form of the Sanskrit *sindhu*, a "river," pre-eminently the Indus, has become familiar since the British acquired the country, and is now officially recognized in the imperial title of the sovereign.

The Country.

General Outline.—India, as thus defined, is the middle of the three irregularly shaped peninsulas which jut out southwards from the mainland of Asia, thus corresponding roughly to the peninsula of Italy in the map of Europe. Its form is that of a great triangle, with its base resting upon the Himálayan range, and its apex running far into the ocean. The chief part of its western side is washed by the Arabian Sea, and the chief part of its eastern side by the Bay of Bengal. It extends from the 8th to the 35th degree of north latitude, that is to say, from the hottest regions of the equator to far within the temperate zone. The capital, Calcutta, lies in 88° E. long.; so that when the sun sets at six o'clock there, it is just past mid-day in England, and early morning in New York. The length of India from north to south, and its greatest breadth from east to west, are both about 1900 miles; but the triangle tapers with a pear-shaped curve to a point at Cape Comorin, its southern extremity. To this compact dominion the English have added, under the name of British Burmah, the strip of country on the eastern shores of the Bay of Bengal. But on the other hand, the adjacent island of Ceylon has been artificially severed, and placed under the colonial office. Two groups of islands in the Bay of Bengal, the Andamans and the Nicobars; one group in the Arabian sea, the Laccadives; and the outlying station of Aden at the mouth of the Red Sea, are all politically included within the Indian empire; while dots on the shore of the peninsula itself, representing Portuguese and French settlements, break at intervals the continuous line of British territory.

Boundaries.

India is shut off from the rest of Asia on the north by a vast mountainous region, known in the aggregate as the Himálayas, amid which lie the independent states of Bhután and Nepál, with the great table-land of Tibet behind. The native principality of Kashmír occupies the north-western angle of India, with Eastern Turkestán stretching to the north beyond it. At this north-western angle (in 35° N. lat., 74° E. long.) the mountains curve southwards, and India is separated by the well-marked ranges of the Sufed Koh and Sulaímán from Afghánistán; and by a southern continuation of lower hills (the Hálas, &c.) from Baluchistán. The last part of the western land frontier of India is formed by the river Hab, and the boundary ends at Cape Monze, at the mouth of its estuary, in 24° 50′ N. lat., 66° 38′ E. long. Still farther southwards, India is bounded along the W. and S.W. by the Arabian Sea and Indian Ocean. Turning northwards from the southern extremity at Cape Comorin (8° 4′ 20″ N. lat., 77° 35′ 35″ E. long.), the long sea-line of the Bay of Bengal forms the main part of its eastern boundary. But on the north-east, as on the north-west, India has again a land frontier. The Himálayan ranges at the north-eastern angle (in about 28° N. lat., 97° E. long.) throw off spurs and chains to the south-east. These spurs, which have been but imperfectly explored, and may possibly constitute an independent mountain system, separate the British provinces of Assam and Eastern Bengal from Independent Burmah. They are known successively as the Abar, Nágá, Patkoi, and Barel ranges. Turning almost due south in 25° lat., they culminate in the Blue Mountain (7100 feet), in 22° 37′ N. lat., 93° 10′ E. long., and then stretch southwards under the name of the Arakan Yomas, separating British Burmah from Independent Burmah, until they again rise into the mountain of Myeng-mateng (4700 feet), in $19\frac{1}{2}$° of N. lat. Up to this point, the eastern frontier follows, generally speaking, the watershed which divides the river systems of the Brahmaputra, Meghna, Kuladan (Koladyne), &c., in Bengal and British Burmah, from the Irawadi basin in Independent Burmah. But from near the base of the Myeng-mateng Mountain, in about $19\frac{1}{2}$° lat., the British frontier stretches almost due east, in an artificial line which divides the lower districts and delta of the Irawadi in British Burmah from the middle and upper districts of that river in Independent Burmah. Stretching south-eastwards from the delta of the Irawadi, a confused succession of little explored ranges separates the British province of Tenasserim from the native kingdom of Siam. The boundary line runs down to Point Victoria at the extremity of Tenasserim (9° 59′ N. lat., 98° 32′ E. long.), following in a somewhat rough manner the watershed between the rivers of the British territory on the west and of Siam on the east.

Three regions.

The empire included within these boundaries is rich in varieties of scenery and climate, from the highest mountains in the world to vast river deltas raised only a few inches above the level of the sea. It forms a continent rather than a country. But if we could look down on the whole from a balloon, we should find that India consists of three separate and well-defined tracts. The first includes the lofty Himálaya mountains, which shut it out from the rest of Asia; and which, although for the most part beyond the British frontier, form an overruling factor in the physical geography of northern India. The second region stretches southwards from the base of the Himálayas, and comprises the plains of the great rivers which issue from them. The third region slopes upward again from the edge of the river plains, and consists of a high three-sided table-land, supported by the Vindhyá mountains on the north, and by the

Eastern and Western Gháts, which run down the coast on either side till they meet at a point near Cape Comorin. The interior three-sided table-land thus enclosed is broken by peaks and ranges, interspersed with broad expanses of level uplands, and covers the whole southern half of the peninsula.

Himálayas.

The first of the three regions is the Himálaya mountains and their offshoots to the southward. The Himálayas—literally, the "Dwelling-place of Snow," from the Sanskrit *hima*, frost (Latin, *hiems*, winter), and *álaya*, a house—comprise a system of stupendous ranges, the loftiest in the world. They are the *Emodus* of Ptolemy (among other names), and extend in the shape of a scimitar, with its edge facing southwards, for a distance of 1500 miles along the northern frontier of India. At the north-eastern angle of that frontier, the Dihang river, the connecting link between the Tsan-pu (Sangpu) of Tibet and the Brahmaputra of Assam, bursts through the main axis of the range. At the opposite or north-western angle, the Indus in like manner pierces the Himálayas, and turns southwards on its course through the Punjab. The Himálayan region has been fully described in a separate article, vol. xi. p. 821.

This wild region is in many parts impenetrable to man, and nowhere yields a passage for a modern army. It should be mentioned, however, that the Chinese outposts extend as far as a point only 6000 feet above the Gangetic plain, north of Khatmandu. Indeed, Chinese armies have seriously threatened Khatmandu itself; and Sir David Ochterlony's advance from the plains of Bengal to that city in 1816 is a matter of history. Ancient and well-known trade routes exist, by means of which merchandise from the Punjab finds its way over heights of 18,000 feet into Eastern Turkestán and Tibet. The Muztagh (Snowy Mountain), the Karakoram (Black Mountain), and the Changchenmo are the most famous of these passes.

The Himálayas not only form a double wall along the north of India, but at both their eastern and western extremities send out ranges to the south, which protect its north-eastern and north-western frontiers. On the north-east, those offshoots, under the name of the Nágá and Patkoi mountains, &c., form a barrier between the civilized British districts and the wild tribes of Upper Burmah. The southern continuations of these ranges, known as the Yomas, separate British from Independent Burmah, and are crossed by pa ses, the most historic of which, the Aeng or An, rises to 4668 (formerly given at 4517) feet, with gradients of 472 feet to the mile.

On the opposite or north-western frontier of India, the mountainous offshoots run down the entire length of the British boundaries from the Himálayas to the sea. As they proceed southwards, their best marked ranges are in turn known as the Sufed Koh, the Suláimán, and the Hála mountains. These massive barriers have peaks of great height, culminating in the Takht-i-Suláimán or Throne of Solomon, 11,317 feet above the level of the sea. But the mountain wall is pierced at the corner where it strikes southwards from the Himálayas by an opening through which the Kábul (Cabul) river flows into India. An adjacent opening, the Khyber Pass (rising to 3373 feet), the Kuram Pass to the south of it, the Gwalarí Pass near Derá Ismáil Khán, the Tál Pass debouching near Derá Ghází Khán, and the famous Bolán Pass (5800 feet at top) still farther south, furnish the gateways between India and Afgháuistán. The Hála, Brahui, and Pab mountains form the southern hilly offshoots between India and Baluchistán, and have a much less elevation.

River plains.

The wide plains watered by the Himálayan rivers form the second of the three regions into which we have divided India. They extend from the Bay of Bengal on the east to the Afghán frontier and the Arabian Sea on the west, and contain the richest and most densely crowded provinces of the empire. One set of invaders after another has from prehistoric times entered by the passes at their eastern and north-western frontiers. They followed the courses of the rivers, and pushed the earlier comers southwards before them towards the sea. About 150 millions of people now live on and around these river plains, in the provinces known as the lieutenant-governorship of Bengal, Assam, the North-Western Provinces and Oudh, the Punjab, Sind, Rájputána, and other native states.

River systems.

The vast level tract which thus covers northern India is watered by three distinct river systems. One of these systems takes its rise in the hollow trough beyond the Himálayas, and issues through their western ranges upon the Punjab as the Sutlej and Indus. The second of the three river systems also takes its rise beyond the double wall of the Himálayas, not very far from the sources of the Indus and the Sutlej. It turns, however, almost due east instead of west, enters India at the eastern extremity of the Himálayas, and becomes the Brahmaputra of Assam and Eastern Bengal. These rivers collect the drainage of the northern slopes of the Himálayas, and convey it, by long and tortuous although opposite routes, into India. Indeed, the special feature of the Himálayas is that they send down the rainfall from their northern as well as from their southern slopes to the Indian plains. Of the three great rivers of northern India, the two longest, namely the Indus with its feeder the Sutlej and the Brahmaputra, take their rise in the trough on the north of the Himálayas. The third river system of northern India receives the drainage of their southern slopes, and eventually unites into the mighty stream of the Ganges. In this way the rainfall, alike from the northern and southern slopes of the Himálayas, pours down into the river plains of Bengal.

Crops.

Throughout the river plains of northern India, two harvests, and in some provinces three, are reaped each year. These crops are not necessarily taken from the same land; but in many districts the best fields have to yield two harvests within the twelve months. In Lower Bengal, pease, pulses, oil-seeds, and green crops of various sorts are reaped in spring; the early rice crops in September; the great rice harvest of the year, and other grains, in November and December. Before these last have been gathered in, it is time to prepare the ground for the spring crops, and the Bengal husbandman knows no rest except during the hot weeks of May, when he is anxiously waiting for the rains. But it should always be remembered that rice is the staple crop in only a limited area of India, and that it forms the everyday food of only a comparatively small proportion of the population. It has been estimated that, in the absence of irrigation, the rice crop requires an annual rainfall of at least 36 inches; and an Indian province requires an average fall of not less than 50 or 60 inches in order to grow rice as its staple crop. A line might almost be drawn across Behar, to the north of which the food of the people ceases to be rice and becomes wheat and millets, &c. There are, indeed, great rice-growing tracts in irrigated or low-lying districts of north-western India, but their produce is consumed by the richer classes or exported.

Scenery.

A detailed account of the most important products will be found under the heading of "Agriculture," farther on in the present article. They are here alluded to only so far as is necessary to give a general idea of the scenery of the river plains. In the northern and drier regions along the upper courses of the rivers, the country rises gently from their channels in fertile undulations, dotted with mud villages and adorned with noble trees. Mango groves scent the air with their blossom in spring, and yield their abundant fruit in summer. The spreading banyan, with its colonnades of hanging roots; the stately *pipal*, with its green masses of foliage; the leafless wild cotton-tree, glowing with heavy crimson flowers; the tall, feathery tamarind, and the quick-growing *bábul*, rear their heads above the fields. As the rivers approach the coast, the palms begin to take possession of the scene. The ordinary landscape in the delta is a flat stretch of rice-fields, fringed round with evergreen masses of bamboos, cocoa-nuts, date-trees, areca, and other coronetted palms. This densely peopled tract seems at first sight bare of villages, for each hamlet is hidden away amid its own grove of plantains and wealth-giving trees. The bamboo and cocoa-nut play a conspicuous part in the industrial life of the people; and the number of products derived from them, including rope, oil, food, and timber, has been dwelt on with admiration by many writers.

The crops also change as we sail down the rivers. In the north, the principal grains are wheat, barley, Indian corn, and a variety of millets, such as *joár* (*Holcus Sorghum*) and *bájra* (*Holcus spicatus*). In the delta, on the other hand, rice is the staple crop and the universal diet. In a single district, Rangpur, 295 separate kinds of rice are known to the peasant, who has learned to grow his favourite crop in every locality, from the solid field, which yields the *áman* harvest, to the swamps 12 feet deep, on the surface of whose waters the rice ears may be seen struggling upwards for air. Sugar-cane, oil-seeds, flax, mustard, sesamum, palma-christi, cotton, tobacco, indigo, safflower, turmeric, ginger, coriander, capsicum, cummin, and many precious spices and dyes are grown both in the North-Western or Upper Provinces, and in the moister valleys and delta of Lower Bengal. A whole pharmacopœia of native medicines, from the well-known aloe and castor-oil to obscure but valuable febrifuges, is derived from shrubs, herbs, and roots. Resins, gums, varnishes, scents, and a hundred articles of commerce or luxury are collected in the fields or forests. Vegetables of many sorts, both indigenous and imported from Europe, form a large part of the food of the people. The melon and huge yellow pumpkin spread themselves over the thatched roofs; fields of potatoes, yams, and *brinjal* are attached to the homesteads. The tea-plant is reared on the hilly ranges that skirt the plains both in the north-west and in Assam; the opium poppy about half down the Ganges, around Benares and Patná; the silk-worm mulberry still farther down in Lower Bengal; while the jute fibre is essentially a crop of the delta, and would exhaust any soil not fertilized by river floods. Even the jungles yield the costly lac dye and *tasar* silk cocoons. The *mahuá*, also a product of the jungle, produces the fleshy flowers which form a staple article of food among the hill tribes, and when distilled supply a cheap spirit. The *sál*, *sissu*, *tún*, and many other indigenous trees yield excellent timber. Flowering creepers, of gigantic size and gorgeous colours, festoon the jungle; while each tank bears its own beautiful crop of the lotus and water-lilies. Nearly every vegetable product that feeds and clothes a people, or enables it to trade with foreign countries, abounds.

them le- d.

We come now to the third division of India, namely the three-sided table-land which covers the southern half or more strictly peninsular portion of India. This tract, known in ancient times as the Deccan (Dakshin), literally "the right hand or south," comprises the Central Provinces, Berar, Madras, Bombay, Mysore, and the native territories of the nizám, Sindhia, Holkar, and other feudatory states. It had in 1872 an aggregate population of over 90 millions. For the sake of easy remembrance, therefore, we may take the inhabitants of the river plains in the north to be now nearly 150 millions, and those of the southern three-sided table-land at nearly 100 millions. The Deccan, in its local acceptation, is restricted to the high tract between the Narbadá (Nerbudda) and the Kistná rivers; but it is popularly understood to include the whole country south of the Vindhyás as far as Cape Comorin. It slopes up from the southern edge of the Gangetic plains. Three ranges of hills support its northern, its eastern, and its western side; and the last two meet at a sharp angle near Cape Comorin.

The Deccan.

The northern side rests on confused ranges, running with a general direction of east to west, and known in the aggregate as the Vindhyá mountains. The Vindhyás, however, are made up of several distinct hill systems. Two sacred peaks guard the flanks in the extreme east and west, with a succession of ranges stretching 800 miles between. At the western extremity, Mount Abu, famous for its exquisite Jain temples, rises, as a solitary outpost of the Aravalli hills, 5650 feet above the Rájputána plain, like an island out of the sea. Beyond the southern limits of that plain, the Vindhyá range of modern geography runs almost due east from Guzerat, forming the northern wall of the Narbadá valley. The Sátpura mountains stretch also east and west to the south of that river, and form the watershed between it and the Tápti. Towards the heart of India the eastern extremities of these two converge in the highlands of the Central Provinces and their lofty level plains. Passing still farther east, the hill system finds a continuation in the Káimur range and its congeners, which eventually end in the outlying peaks and spurs that form the western boundary of Lower Bengal, and abut on the old course of the Ganges under the name of the Rájmahál hills. On the extreme east, Mount Párasnáth—like Mount Abu on the extreme west, sacred to Jain rites—rises to 4400 feet above the level of the Gangetic plains. The various ranges of the Vindhyás, from 1500 to over 4000 feet high, form, as it were, the northern wall and buttresses which support the central table-land. Though now pierced by road and railway, they stood in former times as a barrier of mountain and jungle between northern and southern India, and formed one of the main obstructions to welding the whole into an empire. They consist of vast masses of forests, ridges, and peaks, broken by cultivated valleys and broad high-lying plains.

Gháts.

The other two sides of the elevated southern triangle are known as the Eastern and Western Gháts (Ghauts). These start southwards from the eastern and western extremities of the Vindhyá system, and run along the eastern and western coasts of India. The Eastern Gháts stretch in fragmentary spurs and ranges down the Madras Presidency, here and there receding inland and leaving broad level tracts between their base and the coast. The Western Gháts form the great sea-wall of the Bombay Presidency, with only a narrow strip between them and the shore. In many parts they rise in magnificent precipices and headlands out of the ocean, and truly look like colossal "passes or landing-stairs" (*gháts*) from the sea. The Eastern Gháts have an average elevation of 1500 feet. The Western Gháts ascend more abruptly from the sea to an average height of about 3000 feet, with peaks up to 4700, along the Bombay coast, rising to 7000 and even 8760 in the upheaved angle which they unite to form with the Eastern Gháts, towards their southern extremity.

The inner triangular plateau thus enclosed lies from 1000 to 3000 feet above the level of the sea. But it is dotted with peaks and seamed with ranges exceeding 4000 feet in height. Its best known hills are the Nilgiris (Neilgherries), with the summer capital of Madras, Utakamand, 7000 feet above the sea. The highest point is Dodábetta Peak (8760 feet), at the upheaved southern angle. The interior plateau is approached by several

Western Gháts. famous passes from the level coast-strip on the western side. The Bor-Ghát, for example, ascends a tremendous ravine about 40 miles south-east of Bombay city, to a height of 1798 feet. In ancient times this pass was regarded as the key of the Deccan, and could be held by a small band against any army attempting to penetrate from the coast. A celebrated military road was constructed by the British up the Bor-Ghát, and practically gave the command of the interior to the then rising port of Bombay. A railway line has now been carried up the pass, twisting round the shoulders of mountains, tunnelling through intervening crags, and clinging by a narrow ledge to the face of the precipices. At one point the zigzag is so sharp as to render a circuitous turn impossible, and the trains have to stop and reverse their direction on a levelled terrace. The Thall Ghát, to the north of Bombay, has in like manner been scaled both by road and railway. Another celebrated pass, farther down the coast, connects the military centre of Belgáum with the little port of Vingurla. These "landing-stairs" from the sea to the interior present scenes of rugged grandeur. The trap rocks stand out, after ages of denudation, like circular fortresses flanked by round towers, from the mass of hills behind,—natural fastnesses, which in the Marhattá times were rendered impregnable to Oriental warfare. To the south of Bombay, the passes climb up from the sea through thick forests, the haunt of the tiger and the stately bison. Still farther down the coast, the western mountain wall dips down into the Palghát valley, a remarkable gap, 25 miles broad, and leading by an easy route, only 1500 feet above the sea at its highest point, from the sea-board to the interior. A railway now extends by this passage from Beypur across the peninsula to Madras.

Eastern Gháts. On the eastern side of India, the Gháts form a series of spurs and buttresses for the elevated inner plateau, rather than a continuous mountain wall. They are traversed by a number of broad and easy passages from the Madras coast. Through these openings the rainfall of the southern half of the inner plateau reaches the sea. The drainage from the northern or Vindhyán edge of the three-sided table-land falls into the Ganges. The Narbadá (Nerbudda) and Tápti carry the rainfall of the southern slopes of the Vindhyás and of the Sátpura hills, in almost parallel lines, into the Gulf of Cambay. But from Surat, in 21° 9′ lat., to Cape Comorin, in 8° 4′ lat., no large river succeeds in reaching the western coast from the interior table-land. The Western Gháts form, in fact, a lofty unbroken barrier between the waters of the central plateau and the Indian Ocean. The drainage has therefore to make its way across India to the eastwards, now turning sharply round projecting ranges, now tumbling down ravines, or rushing along the valleys, until the rain which the Bombay sea-breeze has dropped upon the Western Gháts finally falls into the Bay of Bengal.

Rivers of Southern table-land. In this way the three great rivers of the Madras Presidency, viz., the Godávari, the Krishna, and the Káveri (Cauvery), rise in the mountains overhanging the western coast, and traverse the whole breadth of the central table-land before they reach the sea on the eastern shores of India.

The physical geography and the political destiny of the two sides of the Indian peninsula have been determined by the characteristics of the mountain ranges on either coast. On the east, the country is comparatively open, and was everywhere accessible to the spread of civilization. On the east, therefore, the ancient dynasties of southern India fixed their capitals. Along the west, only a narrow strip of lowland intervenes between the barrier range and the seaboard. The inhabitants of those tracts remained apart from the civilization of the eastern coast. To this day one of their ruling races, the Nairs, retain land-tenures and social customs, such as polyandry, which mark a much ruder stage of human advancement than Hinduism, and in other parts of India only linger among isolated hill tribes. On the other hand, the people of the western coast enjoy a bountiful rainfall, unknown in the inner plateau and the east.

Rainfall of southern table-land. The monsoon dashes its rain-laden clouds against the Western Gháts, and pours from 250 to 100 inches of rain upon their maritime slopes from Khándesh down to Malabar. By the time that the monsoon has crossed the Western Gháts, it has dropped the greater part of its aqueous burden, and central districts, such as Bangalore, obtain only about 35 inches. The eastern coast also receives a monsoon of its own; but, except in the neighbourhood of the sea, the rainfall throughout the Madras presidency is scanty, seldom exceeding 40 inches in the year. The deltas of the three great rivers along the Madras coast form, of course, tracts of inexhaustible fertility; and much is done by irrigation on the thirsty inland plateau to husband and utilize both the local rainfall and the accumulated waters which the rivers bring down.

Crops. In the valleys, and upon the elevated plains of the central plateau, tillage has driven back the jungle to the hilly recesses, and fields of rice and many kinds of smaller grain or millets, tobacco, cotton, sugar-cane, and pulses spread over the open country. The black soil of the Deccan is proverbial for its fertility; and the level strip between the Western Gháts and the sea rivals even Lower Bengal in its fruit-bearing palms, rice harvests, and rich succession of crops. The deltas on the eastern side have from time immemorial been celebrated as rice-bearing tracts. The interior of the table-land, as may be inferred from the scanty rainfall, is liable to drought. The people contend against the calamities of nature by varied systems of irrigation,—drawing their water-supply in some districts from wells, in others from tanks and reservoirs, or from large artificial lakes formed by damming up the ends of river valleys. They thus store the rain brought during a few months by the monsoon, and husband it for use throughout the whole year. The food of the common people consists chiefly of small grains, such as *joár*, *bájra*, and *rági*. The great export is cotton, with wheat from the northern districts of Bombay. The pepper trade with Malabar dates far beyond the age of Sindbad the Sailor, and probably reaches back to Roman times. Cardamoms, spices of various sorts, dyes, and many medicinal drugs are also grown.

Minerals. It is on the three-sided table-land, and among the hilly spurs which project from it, that the mineral wealth of India lies hid. Coal-mining now forms a great industry on the north-eastern side of the table-land, in Bengal, and also in the Central Provinces. The commercial aspects of this and similar undertakings will be dealt with in a later section of the present article. Beds of iron-ore and limestone have been worked in several places, and hold out a possibility of a new era of enterprise to India in the future. Many districts are rich in building stone, marbles and the easily worked laterite. Copper and other metals exist in small quantities. Gold dust has from very ancient times been washed out of the river-beds, and gold-mining is being attempted on scientific principles in Madras and Mysore.

Of the three regions of India, now briefly surveyed, the first, or the Himálayas, lies for the most part beyond the British frontier, but a knowledge of it supplies the key to the ethnology and history of India. The second region, or the great river plains in the north, formed the theatre of the ancient race-movements which shaped the civilization and the political destinies of the whole Indian peninsula. The third region, or the triangular table-land in the south, has a character quite distinct from either of the other two divisions, and a population which is now working out a separate development of its own. Broadly speaking, the Himálayas are peopled by Turanian tribes; the great river plains of Hindustán are still the home of the Aryan race; the triangular table-land has formed an arena for a long struggle between that gifted race from the north and what is known as the Dravidian stock in the south.

British Burmah. To this vast empire the English have added British Burmah, consisting of the lower valley of the Irawadi (Irrawaddy) with its delta, and a long flat strip stretching down the eastern side of the Bay of Bengal. Between the narrow maritime tract and the Irawadi runs a backbone of lofty ranges. These ranges, known as the Yoma (Roma) mountains, are covered with dense forests, and both historically and geographically separate the Irawadi valley from the strip of coast. The Yoma (Roma) ranges have peaks exceeding 4000 feet, and culminate in the Blue Mountain (7100 feet). They are crossed by passes, one of which, the An or Aeng, rises to 4668 feet above the sea-level. A thousand creeks indent the seaboard; and the whole of the level country, both on the coast and in the Irawadi valley, forms one vast rice-field. The river floats down an abundant supply of teak and bamboos from the north. Tobacco, of an excellent quality, supplies the little cigars which all Burmese (men, women, and children) smoke. Arakan and Pegu, or the provinces of the coast strip and the Irawadi valley, contain mineral oil-springs. Tenasserim forms a long narrow maritime province, which runs from the mouths of the Irawadi southward to Point Victoria, where the British territory adjoins Siam. It is rich in tin mines, and contains iron-ores equal to the finest Swedish, besides gold and copper in smaller quantities, and a very pure limestone. Rice and timber form the staple exports of Burmah; and rice is also the universal food of the people. British Burmah, with Tenasserim, has an area of 88,556 square miles, and had a population, in 1876, of just under 3 millions of persons.

Geology.

For geological purposes India may be mapped out into the three geographical divisions of the Himálayan region, the Indo-Gangetic plain, and Peninsular India.

Himálayas.

The Himálayan Region.—The geology of this district is far more complex and less fully known than that of the Peninsular area. Until the ground has been carefully gone over by the Geological Survey, many points must remain doubtful; probably even then the problems will not be fully solved, as large areas of the Himálayas (Nepál and Bhután) are at present inaccessible to Europeans. The oldest rock of the Himálayas is gneiss, but its age is quite unknown. It generally differs in character from the gneiss of the Peninsula, and also from that of Assam and Burmah. The Himálayan gneiss is usually white and grey, its felspars being orthoclase and albite; it contains much mica and mica schist, and is generally much more uniform in character than the gneiss of the Peninsula. The latter is usually pink, its felspar being orthoclase and oligoclase; it contains little mica schist, but often has quartzite and hornblendic rock. Hornblende occurs in the syenitic gneiss of the Northern Himálayan (or Ladákh) range. The Central Himálayan region may be roughly described as consisting of two gneissic axes, with a trough or synclinal valley between them, in which fossiliferous beds have been deposited and are now preserved. The gneiss of the southern or main axis (the "central gneiss" of Dr Stoliczka) is the oldest; that of the northern or Ladákh axis comes next in age. The gneiss of the Ladákh axis is generally syenitic, or is that variety of the Himálayan gneiss already described as containing hornblende. It is probably an extremely altered condition of ordinary marine sediment. The gneiss of the central axis is the ordinary kind; it is penetrated by granite, which ranges along some of the highest peaks. Between these two gneissic axes occurs the basin-shaped valley, or the Hundes and Zanskar synclinal. In this valley fossiliferous rocks are preserved, giving representatives of the Silurian, Carboniferous, Triassic, Jurassic, and Cretaceous formations. All these seem there to have followed each other without important breaks or unconformities; but after the deposition of the Cretaceous rocks of the Himálayan region, there appear to have been important changes in physical geography. The Nummulitic (Eocene) strata were laid down on the eroded edges of some of the older beds, and in a long trough within the Silurian gneiss of the Ladákh axis. On the south of this true Himálayan region there is a band of country known as the Lower Himálaya, in which the beds are often greatly disturbed, and even completely inverted, over great areas, the old gneiss apparently overlying the sedimentary rocks. This Lower Himálayan region is about 50 miles wide, and consists of irregular ridges, varying from 5000 to 8000 feet in height, and sometimes reaching 12,000 feet.

Lower Himálayas.

Resting upon the gneiss, but often through inversion apparently underlying it, in the neighbourhood of Simla, is a series of unfossiliferous beds (schists, quartzites, sandstones, shales, limestones, &c.) known in descending order as the Król, Infra-Król, Blaini, and Infra-Blaini beds. In the Król beds is a massive limestone (Król limestone) probably representing the limestone of the Pir Panjál range, which is most likely of Carboniferous age. The Blaini and Infra-Blaini beds are probably Silurian. The Lower Himálayan range ends at the Sutlej valley, west of which the continuation of the central range is followed immediately by the third or Sub-Himálayan range. This occurs almost always on the south of the Lower Himálayas; it is composed of later Tertiary rocks (Siwáliks, &c.), which range parallel with the main chain. Generally the Sub-Himálayas consist of two ranges, separated by a broad flat valley ("dún" or "doon"); the southern slope, overlooking the great Indo-Gangetic plain, is usually the steepest. Below Náini Tál and Dárjíling (Darjeeling), the sub-Himálayan range is wanting; on the Bhután frontier the whole range is occasionally absent, and then the great plain slopes up to the base of the Lower Himálayan region. It is within the Sub-Himálayan range that the famous Siwálik beds occur, long since known for their vast stores of extinct mammalia. Of about the same age are the Manchhar beds of Sind, which also contain a rich mammalian fauna. The Lower Manchhars probably correspond to the Náhan beds, the lowest of the Siwáliks; they rest upon the Gaj beds, which are probably Upper Miocene. From this it would seem that the lowest Siwáliks are not older than Upper Miocene. The higher Siwálik beds are considered by Mr W. T. Blanford to be Pliocene, and to this later period he also refers the mammalian beds of Pikermi in Greece. These have a large number of fossils in common with the Siwáliks; but they contain, at their base, a marine band with Pliocene shells. The Manchhar and Siwálik beds are chiefly of freshwater origin.

Sub-Himálayas.

Siwáliks.

Salt Range.

The Salt Range in the north-west of the Punjab has, in addition to its economic value, a special geological importance; and from that point of view it is one of the most interesting districts in India. Representatives of most of the great European formations of Silurian and later epochs are found there; and throughout all the vast length of time represented by these formations there is here no direct evidence of any important break in succession, or unconformity. The lowest beds (salt marl, probably Silurian) and the highest (Siwáliks) are found throughout the range. But the others cannot all be traced continuously throughout; some occur well developed in one place, some in another. All the principal fossiliferous beds of the Jurassic, Triassic, and Carboniferous formations are confined to the western part of the range.

Indo-Gangetic Plain.

The *Indo-Gangetic Plain* covers an area of about 300,000 square miles, and varies in width from 90 to nearly 300 miles. It rises very gradually from the sea at either end; the lowest point of the watershed between the Punjab rivers and the Ganges is about 924 feet above the sea. This point, by a line measured down the valley, but not following the winding of the river, is about 1050 miles from the mouth of the Ganges and 850 miles from the mouth of the Indus, so that the average inclination of the plain, from the central watershed to the sea, is only about 1 foot per mile. It is less near the sea, where for long distances there is no fall at all. It is generally more near the watershed; but there is here no ridge of high ground between the Indus and the Ganges, and a very trifling change of level would often turn the upper waters of one river into the other. It is not unlikely that such changes have in past time occurred; and if so an explanation is afforded of the occurrence of allied forms of freshwater dolphins (*Platanista*) and of many other animals in the two rivers and in the Brahmaputra.

Its age. There is no evidence that the Indo-Gangetic plain existed as such in Pre-Tertiary times. It is highly probable that the Jurassic and Cretaceous coast-line ran across the northern part of the Bay of Bengal, and that most of the area now occupied by the Gangetic plain was then above the sea. Probably the Jurassic traps of the Rájmahál hills, west of the delta of the Ganges, were continuous with those of Sylhet, east of the delta. Marine Jurassic and Cretaceous beds are absent from the margins of the true Gangetic plain; so too are marine Eocene beds. In Eocene times the sea spread up the Punjab; but that too was land only in Miocene times.

Alluvial deposits. The alluvial deposits of the plain, as made known by the boring at Calcutta, prove a gradual depression of the area through the later Tertiary times. There are peat and forest beds, which must have grown quietly at the surface, alternating with deposits of gravel, sand, and clay. The thickness of the delta deposit is unknown; 481 feet was proved at the bore hole, but probably this represents only a very small part of the deposit. Outside the delta, in the Bay of Bengal, is a deep depression known as the "swatch of no ground"; all around it the soundings are only of 5 to 10 fathoms, but they very rapidly deepen to over 300 fathoms. Mr J. Ferguson has shown that the sediment is carried away from this area by the set of the currents; probably then it has remained free from sediment whilst the neighbouring sea bottom has gradually been filled up. If so, the thickness of the alluvium is at least 1800 feet, and may be much more.

The Indo-Gangetic plain dates back to Eocene times; the origin of the Himálayas may be referred to the same period. Numerous minor disturbances occurred in the area which is now northern India during Palæozoic and Secondary times, but the great disturbance which has resulted in the formation of the existing chain of the Himálayas took place after the deposition of the Eocene beds. Disturbances even greater in amount occurred after the deposition of the Pliocene beds. The Eocenes of the Sub-Himálayan range were deposited upon uncontorted Palæozoic rocks, but the whole has since been violently contorted and disturbed. There are some indications that the disturbing forces were more severe to the eastward during middle Tertiary times, and that the main action to the westward was of later date. It seems highly probable that the elevation of the mountain ranges and the depression of the Indo-Gangetic plain were closely related. This view gains some support from a glance at the map, where we see that the curves of the great mountain chains are strictly followed by those of the great alluvial plain. Probably both are due to almost contemporary movements of the earth's crust; these movements, though now of vastly diminished intensity, have not wholly ceased. The alluvial deposits prove depression in quite recent geological times; and within the Himálayan region earthquakes are still common, whilst in Peninsular India they are rare.

Peninsular India.—The oldest rocks of this area consist of gneiss, which occurs in three districts:—a very large part of Bengal and Madras, extending to Ceylon; the Aravalli; and Bundelkhand. Of these formations, the gneiss of Bundelkhand is known to be the oldest, because the oldest Transition rocks rest upon it; whereas the same Transition rocks are altered and intersected by granitic dykes which proceed from the gneiss of the other districts. The Transition rocks are of great but unknown age. The Vindhyan rocks which succeed them are of very old Palæozoic age, perhaps Pre-Silurian. But long before the earliest Vindhyan rocks were laid down the Transition rocks had been altered and contorted. The great movements of the earth's crust which produced that contortion are the latest which have taken place to any great extent in the Indian Peninsula. In more recent times there have been local disturbances, and large faults have in places been found; but the greater part of the Peninsula rocks are only slightly disturbed, and the most recent of the great and wide-spread earth movements of this region date back to Pre-Vindhyan times. The Vindhyan series are generally sharply marked off from older rocks; but in the Godávari valley there is no well-defined line between these and the Transition rocks. The Vindhyan beds are divided into two groups. The lower, with an estimated thickness of only 2000 feet, or slightly more, cover a large area,—extending, with but little change of character, from the Son valley in one direction to Cuddapah, and in a diverging line to near Bijápur—in each case a distance of over 700 miles. The upper Vindhyans cover a much smaller area, but attain a thickness of about 12,000 feet. The Vindhyans are well stratified beds of sandstone and shale, with some limestones. As yet they have yielded no trace of fossils, and their exact age is consequently unknown. So far as the evidence goes, it appears probable that they are of very ancient Palæozoic age, perhaps Pre-Silurian. The total absence of fossils is a remarkable fact, and one for which it is difficult to account, as the beds are for the most part quite unaltered. Even if they are entirely of freshwater origin, we should expect that some traces of life from the waters or neighbouring land would be found.

Pen[insu]lar [gneiss]. Vin[dhyan] rock[s].

Gondwána series. The Gondwána series is in many respects the most interesting and important series of the Indian Peninsula. The beds are almost entirely of freshwater origin. Many subdivisions have been made, but here we need only note the main division into two great groups:—Lower Gondwánas, 13,000 feet thick; Upper Gondwánas, 11,000 feet thick. The series is mainly confined to the area of country between the Narbadá and the Son on the north and the Krishna on the south; but the western part of this region is in great part covered by newer beds. The lowest Gondwánas are very constant in character, wherever they are found; the upper numbers of the lower division show more variation, and this divergence of character in different districts becomes more marked in the Upper Gondwána series. Disturbances have occurred in the lower series before the formation of the upper.

The Gondwána beds contain fossils which are of very great interest. In large part these consist of plants which grew near the margins of the old rivers, and which were carried down by floods, and deposited in the alluvial plains, deltas, and estuarine areas of the old Gondwána period. So vast was the time occupied by the deposition of the Gondwána beds that great changes in physical geography and in the vegetation repeatedly occurred. The plants of the Lower Gondwánas consist chiefly of acrogens (*Equisetaceæ* and ferns) and gymnogens (cycads and conifers), the former being the more abundant. The same classes of plants occur in the Upper Gondwánas; but there the proportions are reversed, the conifers, and still more the cycads, being more numerous than the ferns, whilst the *Equisetaceæ* are but sparingly found. But even within the limits of the Lower Gondwána series there are great diversities of vegetation, three distinct floras occurring in the three great divisions of that formation. In many respects the flora of the highest of these three divisions (the Pánchet group) is more nearly related to that of the Upper Gondwánas than it is to the other Lower Gondwána floras.

One of the most interesting facts in the history of the Gondwána series is the occurrence near the base (in the Tálcher group) of large striated boulders in a fine mud or silt, the boulders in one place resting upon rock (of Vindhyan age) which is also striated. There seems good reason for believing that these beds are the result of ice-action. They probably nearly coincide in age with the Permian beds of Western Europe, in which Professor Ramsay long since discovered evidence of glaciation. But the remarkable fact is that this old ice-action occurred within the tropics, and probably at no very great height above the sea.

The Dámodar series, the middle division of the Lower Gondwánas, is the chief source of coal in Peninsular India, yielding more of that mineral than all other formations taken together. The Karharbári group is the only other coal-bearing formation of any value. The Dámodars are 8400 feet thick in the Rániganj coal-field, and about 10,000 feet thick in the Sátpura basin. They consist of three divisions; coal occurs in the upper and lower, ironstone (without coal) in the middle division. The Ránîganj coal-field is the most important in India. So far as is yet known, it covers an area of about 500 square miles, extending about 18 miles from north to south and about 39 miles from east to west; but it extends further to the east under the laterite and alluvium. It is traversed by the Dámodar river, along which run the road from Calcutta to Benares and the East Indian Railway. From its situation and importance this coal-field is better known than any other in India. Much has been learnt concerning it since the last examination by the Geological Survey, and our remarks are in great part based on recent reports by Mr H. Bauerman. The upper or Ránîganj series (stated by the Geological Survey to be 5000 feet thick) contains eleven seams, having a total thickness of 120 feet, in the eastern district, and thirteen seams, 100 feet thick, in the western district. The average thickness of the seams worked is from 12 to 18 feet, but occasionally a seam acquires a great thickness—20 to 80 feet. The lower or Barákhar series (2000 feet thick) contains four seams, of a total thickness of 69 feet. Compared with English coals those of this coal-field are of but poor quality; they contain much ash, and are generally non-coking. The seams of the lower series are the best, and some of these at Sánktoria, near the Barákhar river, are fairly good for coke and gas. The best coal in India is in the small coal-field at Karharbári. The beds there are lower in the series than those of the Ránîganj field; they belong to the upper part of the Tálcher group, the lowest of the Gondwána series. The coal-bearing beds cover an area of only about 11 square miles; there are three seams, varying from 9 to 33 feet thick. The lowest seam is the best, and this is as good as English steam coal. This coalfield, now largely worked, is the property of the East Indian Railway, which is thus supplied with fuel at a cheaper rate than any other railway in the world. Indian coal usually contains phosphoric acid; which greatly lessens its value for iron-smelting.

The Dámodar series, which, as we have seen, is the chief source of coal in India, is also one of the most important sources of iron. The ore occurs in the middle division, coal in the highest and lowest. The ore is partly a clay ironstone, like that occurring in the Coal-measures of England, partly an oxide of iron or hæmatite. It generally contains phosphorus, which prevents its use in the preparation of the finer qualities of steel. A similar difficulty attends the use of the Cleveland ore of North Yorkshire. Experiments have been in progress for years in search of a process which shall, in an economical manner, obtain iron from Cleveland ore free from phosphorus, latterly, it is hoped, with some success. If this be so, India will be a great gainer. Excellent iron-ore occurs in the Metamorphic rocks south of the Dámodar river. Laterite (see below) is sometimes used as ore. It is very earthy and of a low percentage; but it contains only a comparatively small proportion of phosphorus.

The want of limestone for flux, within easy reach, is generally a great drawback as regards iron-smelting in India. *Kankar* or *ghutin* (concretionary carbonate of lime) is collected for this purpose from the river beds and alluvial deposits. It sometimes contains as much as 70 per cent. of carbonate of lime; but generally the amount is much less and the fluxing value proportionally diminished. The real difficulty in India is to find the ore, the fuel, and the flux in sufficiently close proximity to yield a profit.

Deccan trap. The enormous mass of basaltic rock known as the Deccan trap is of great importance in the geological structure of the Indian Peninsula. It now covers an area of about 200,000 square miles, and probably formerly extended over a much wider area. Where thickest, the traps are at least 6000 feet thick. They form the most striking physical features of the country, many of the most prominent hill ranges being the denuded edges of the basaltic flows. The great volcanic outbursts which produced this trap commenced in the Cretaceous period and lasted on into the Eocene period.

Laterite. Laterite is a ferruginous and argillaceous rock, varying from 30 to 200 feet thick, which often occurs over the trap area, but is also found in other districts. As a rule it makes rather barren land; it is highly porous, and the rain rapidly sinks into it. Laterite may be roughly divided into two kinds, high-level and low-level laterites. The former, which covers a large area of the high basaltic plains, is believed by Mr R. B. Foote to be very frequently the product of decomposition of the trap, and to have been thus formed in the place in which it is now found. Sometimes the high-level laterite overlies gneiss or other rocks; and in these cases it has probably been transported. The low-level laterite is generally more sandy in character, and is often associated with gravels. In most cases this has clearly been carried down to its present position, probably largely by subaerial action, aided by rains and streams. Possibly in some cases it has been spread out along the coasts by marine action. The low-level laterite fringes the coast of the Peninsular more or less from near Bombay on the west and Orissa on the east to Cape Comorin. It is not continuous throughout these districts; and it is of very varying width and elevation. The age of the high-level laterite is unknown. Its formation probably extended throughout a long period of time, much of which must be of very ancient date; for the laterite, together with the underlying basalt, has suffered extensive denudation.

The mercantile aspects of the coal, iron, and other mineral products of India will be fully treated of under a subsequent section (pp. 764-66). The geologist comes in this matter to the same conclusion as the economist, viz., that the mineral wealth of India, as represented by its precious stones, was the product of forced labour, and that the search for them in our days can scarcely repay the working expenses.

[For the above section on Geology we are indebted to Mr W. Topley of the English Geological Survey.]

Meteorology.

Meteorology. The great peninsula of India, with its lofty mountain ranges behind and its extensive seaboard exposed to the first violence of the winds of two oceans, forms an exceptionally valuable and interesting field for the study of meteorological phenomena. But only within the last few years have trustworthy statistics been obtained for some of its most important registration stations.

Meteorological Geography.—After the general description of the country which has been given at the beginning of this article, it is only necessary here to sketch very briefly the meteorological geography of the peninsula. The following sentences are condensed from an interesting account in the first *Report on the Meteorology of India* (for 1875), by Mr H. F. Blanford. From the gorge of the Indus to that of the Dihong (Brahmaputra), a distance of 1400 miles, the Himálayas form an unbroken watershed, the northern flank of which is drained by the upper valleys of these two rivers; while the Sutlej (Satlaj), starting from the southern foot of the Kailas Peak, breaks through the watershed, dividing it into two very unequal portions, that to the north-west being the smaller. The average elevation of the Himálaya crest may be taken at not less than 19,000 feet, and therefore equal to the height of the lower half of the atmosphere; and indeed few of the passes are under 16,000 or 17,000 feet. Across this mountain barrier there appears to be a constant flow of air, more active in the day-time than at night, northwards to the arid plateau of Tibet. There is no reason to believe that any transfer of air takes place across the Himálayas in a southerly direction, unless, indeed, in those most elevated regions of the atmosphere which lie beyond the range of observation; but a nocturnal flow of cooled air, from the southern slopes, is felt as a strong wind where the rivers debouch on the plains, more especially in the early morning hours; and this probably contributes in some degree to lower the mean temperature of that belt of the plains which fringes the mountain zone.

Himálayas.

Indus plain. At the foot of the great mountain barrier, and separating it from the more ancient land which now forms the highlands of the peninsula, a broad plain, for the most part alluvial, stretches from sea to sea. On the west, in the dry region, this is occupied partly by the alluvial deposits of the Indus and its tributaries and the saline swamps of Kahhch (Cutch), partly by the rolling sands and rocky surface of the desert of Jáisalmír and Bíkanir, and the more fertile tracts to the eastward watered by the Lúnai. Over the greater part of this region rain is of rare occurrence; and not infrequently more than a year passes without a drop falling on the parched surface. On its eastern margin, however, in the neighbourhood of the Aravalli hills, and again on the northern Punjab, rain is more frequent, occurring both in the south-west monsoon, and also at the opposite season in the cold weather. As far south as Sírsa and Múltán (Mooltan), the average rainfall does not much exceed 7 inches.

Gangetic plain. The alluvial plain of the Punjab passes into that of the Gangetic valley without visible interruption. Up or down this plain, at opposite seasons, sweep the monsoon winds, in a direction at right angles to that of their nominal course; and thus vapour which has been brought by winds from the Bay of Bengal is discharged as snow and rain on the peaks and hillsides of the Western Himálayas. Nearly the whole surface is under cultivation, and it ranks among the most productive as well as the most densely populated regions of the world. The rainfall diminishes from 100 inches in the south-east corner of the Gangetic delta to less than 30 inches at Agra and Delhi, and there is an average difference of from 15 to 25 inches between the northern and southern borders of the plain.

Eastern Bengal. Eastward from the Bengal delta, two alluvial plains stretch up between the hills which connect the Himálayan system with that of the Burmese peninsula. The first, or the valley of Assam and the Brahmaputra, is long and narrow, bordered on the north by the Himálayas, on the south by the lower plateau of the Gáro, Khásí, and Nágá hills. The other, short and broad, and in great part occupied by swamps and *jhils*, separates the Gáro, Khásí, and Nágá hills from those of Tipperah and the Lusháí country. The climate of these plains is damp and equable, and the rainfall is prolonged and generally heavy, especially on the southern slopes of the hills. A meteorological peculiarity of some interest has been noticed, more especially at the stations of Síbságar and Silchár, viz., the great range of the diurnal variation of barometric pressure during the afternoon hours,—which is the more striking, since at Rúrkí (Roorkee), Lahore, and other stations near the foot of the Western Himálayas, this range is less than in the open plains.

Central tableland. The highlands of the peninsula, which are cut off from the encircling ranges by the broad Indo-Gangetic plain, are divided into two unequal parts, by an almost continuous chain of hills running across the country from west by south to east by north, just south of the Tropic of Cancer. This chain may be regarded as a single geographical feature, forming one of the principal watersheds of the peninsula, the waters to the north draining chiefly into the Narbadá and the Ganges, those to the south into the Tápti, the Godávari, the Mahánadi, and some smaller streams. In a meteorological point of view it is of considerable importance. Together with the two parallel valleys of the Narbadá (Nerbudda) and Tápti (Taptee), which drain the flanks of its western half, it gives, at opposite seasons of the year, a decided easterly and westerly direction to the winds of this part of India, and condenses a tolerably copious rainfall during the south-west monsoon.

Separated from this chain by the valley of the Narbadá on the west, and that of the Son on the east, the plateau of Málwá and Baghelkhand occupies the space intervening between these valleys and the Gangetic plain. On the western edge of the plateau are the Aravalli hills, which run from near Ahmadábád up to the neighbourhood of Delhi, and include one hill, Mount Abu, over 5000 feet in height. This range exerts an important influence on the direction of the wind, and also on the rainfall. At Ajmír (Ajmere), an old meteorological station at the eastern foot of the range, the wind is predominantly south-west, and there and at Mount Abu the south-west monsoon rains are a regularly recurrent phenomenon,—which can hardly be said of the region of scanty and uncertain rainfall that extends from the western foot of the range and merges in the Bíkanir desert.

Southern plateau. The peninsula south of the Sátpura range consists chiefly of the triangular plateau of the Deccan, terminating abruptly on the west in the Sahyádri range (Western Gháts), and shelving to the east (Eastern Gháts). This plateau is swept by the south-west monsoon, but not until it has surmounted the western barrier of the Gháts; and hence the rainfall is, as a rule, light at Poona and places similarly situated under the lee of the range, and but moderate over the more easterly parts of the plateau. The rains, however, are prolonged some three or four weeks later than in tracts to the north of the Sátpuras, since they are also brought by the easterly winds which blow from the Bay of Bengal in October and the early part of November, when the recurved southerly wind ceases to blow up the Gangetic valley, and sets towards the south-east coast. This was formerly thought to be a north-east monsoon, and is still so spoken of by certain writers; but the rainy wind is really a diversion of the south-west monsoon.

At the junction of the Eastern and Western Gháts rises the bold triangular plateau of the Nílgiris, and to the south of them come the Anamalais, the Palnis (Pulneys), and the hills of Travancore. These ranges are separated from the Nílgiris by a broad depression or pass known as the Pálghát Gap, some 25 miles wide, the highest point of which is only 1500 feet above the sea. This gap affords a passage to the winds which elsewhere are barred by the hills of the Ghát chain. The country to the east of the gap receives the rainfall of the south-west monsoon; and during the north-east monsoon ships passing Beypur meet with a stronger wind from the land than is felt elsewhere on the Malabar coast. According to Captain Newbold, this gap "affords an outlet to those furious storms from the eastward which sweep the Bay of Bengal, and, after traversing the peninsula, burst forth through it to the neighbouring sea."

In the strip of low country that fringes the peninsula below the Gháts, the rainfall is heavy and the climate warm and damp, the vegetation being dense and characteristically tropical, and the steep slopes of the Gháts, where they have not been artificially cleared, thickly clothed with forest.

In Burmah, the country around Ava, as well as the hill country to the north, has suffered from severe earthquakes, one of which destroyed Ava in 1839. The general meridianal direction of the ranges and valleys determines the direction of the prevailing surface winds, this being, however, subject to many local modifications. But it would appear, from Dr Anderson's observations of the movement of the upper clouds, that throughout the year there is, with but slight interruption, a steady upper current from the south-west, such as has been already noticed over the Himálayas. The rainfall in the lower part of the Irawadi valley, viz., the delta and the neighbouring part of the province of Pegu, is very heavy; and the climate is very mild and equable at all seasons. But higher up the valley, and especially north of the Pegu frontier, the country is drier, and is characterized by a less luxuriant vegetation, and a retarded and more scanty rainfall.

Observatories.—Meteorological observatories have been established at one hundred and three stations in India (including British Burmah and the Andamans). These observatories are situated at all elevations, from the highest, Leh (11,538 feet above mean sea-level) and Chakráta (7051 feet), to Negapatam (15 feet) and Ságar Island, the lowest, which is only 6 feet above mean sea-level.

Temperature of the Air.—From the average annual mean temperatures of 83 stations (derived from the means of three or more years) the following figures are taken. In the following four stations in this list, the average mean yearly temperature was over 82° F.:—Trichinopoli, 82·8°; Vizagapatam, 82·7°; Madras, 82·4°; and Madura, 82·2.° All of these stations are in the Madras Presidency. The next highest means are returned by Negapatam (also in Madras), 81·9°; Cuttack and Port Blair, each 80·5°; False Point, 80·20°; Goa, 79·9°; Cochin, 79·8°; Ságar Island, 79·5°; Deesa, 79·4°; and Calcutta, 79·2°. The mean annual temperature of Bombay is 78·8°, so that it is the coolest of the three presidency towns. The lowest means are obtained at the hill stations of Dárjíling, 53·9°; Simla, 54·4°; Murree, 55·8°; and Chakráta, 56·1°. Between these and the next coolest stations is a great gap, Ráníkhet following with 60·4°, Pachmarhi with 68·7°, and Ráwal Pindí with a yearly mean of 69·4°. The highest mean monthly temperatures given are:—95° at Múltán, in June; 94·3° at Delhi, in June; 94·1° at Jhánsi, in May; 93·6° at Lucknow, in June. The lowest monthly means are returned by the four coldest hill stations mentioned above, the figures being:—Murree—January 37·7°, February 39·4°; Simla—January 39·6°, February 41·1°; Chakráta—January 40·8°, February 42·9°; Dárjíling—January 40·7°, February 43·2°. The mean temperature at Leh in January is 17·6°, and in December 24·4°.

Atmospheric Pressure.—The meteorological report for 1877 contains a table showing the annual mean pressure at 72 stations, corrected (except in the case of Madras) to the Calcutta standard, which reads 0·011 inch higher than that of Kew. From that table the following figures are obtained. The mean yearly pressure at the highest stations is—23·274 at Chakráta, 23·371 at Dárjíling, 24·058 at Ráníkhet, 26·416 at Pachmarhi, and 26·932 at Bangalore. The greatest annual mean pressures returned are—29·862 at Negapatam, 29·856 at Madras, 29·822 at Bombay, and 29·821 at False Point.

Rainfall.—The average annual rainfall at 294 stations is recorded in the 1877 meteorological report, from which the following figures have been obtained:— Rainfall.

In the Punjab the highest average fall (123·21 inches) is at Dharmsála, which is situated on the face of the hills, and exposed to the full force of the monsoon; the next highest recorded is little more than half that amount, or 68·61 inches at Simla. The lowest average falls in the Punjab are—6·16 inches at Muzaffargarh, 6·93 at Múltán, 7·35 at Derá Ghází Khán, and 8·23 at Derá Ismáil Khán. All these stations are protected by the Suláimán range from the monsoon.

In Rájputána and Central India the maximum average is 20·27 at Jáipur (Jeypore), and the minimum, 60·85 at Mount Abu, the highest point in this part of India.

In the North-Western Provinces the heaviest average falls are at Náini Tál (94·17 inches) and Dehra (70·06), both of which lie high; the minimum average fall is 24·32 at Alígarh, the next lowest figures being 26·18 at Muttra (Mathura), 26·46 at Agra, and 26·74 at Etah—all stations on the plains.

In Oudh the maximum rainfall is at Sultánpur, 46·72 inches; and the minimum at Rái Bareli, 39·99 inches.

The following stations of Bengal have an average rainfall of more than 100 inches:—Jalpáiguri, 122·16; Dárjíling, 119·25; and Kuch Behár, 119·05—all at the base of the hills; Noákhálí, 107·52, and Chittagong, 105·61, both on the north-east coast of the Bay of Bengal. The lowest averages are returned by Chapra, 37·06 inches; Patná, 38·21; and Gáyá, 41·38. The average rainfall for Bengal is 67 inches.

Assam possesses in Cherra Poonjee (Chárá Punji) the station with the largest recorded rainfall in the world. The registered fall during the three years ending 1876 averaged 368·41 inches. A total fall of 805 inches was reported in 1861, of which 366 were assigned to the single month of July. In 1850 Dr Hooker registered 30 inches in twenty-four hours, and returned the fall from June to November of that year at 530 inches. In the four days 9th to 12th September 1877, 56·19 inches were registered. The following stations in Assam have also a very high rainfall:—Silchár, 121·07; Sylhet, 153·80; Dibrugarh, 116·43; and Tura, 115·76. The lowest recorded averages in Assam are at Samaguting (52·58 inches) and Gauháti (69·23 inches), both on the northern side of the hills separating Cachar from Assam.

In the Central Provinces the highest average falls are at Pachmarhi (82·20 inches) and Bálághát (64·11 inches); lowest averages, Khandwa, 32·26 inches, and Bednúr, 41·21 inches.

In Bombay, three stations on the Gháts are recorded as having an average rainfall of over 250 inches, viz.:—Matheran, 256·75 inches; Malcolmpet (Mahábleshwar), 252·25; and Baura (Fort), 251·80. The lowest average rainfalls recorded in Bombay are—12·99 inches at Mandargi; 17·25 at Dhulia; and 19·93 at Gokak. The average rainfall for Bombay is 67 inches.

In Sind the average rainfall is very low, varying from 16·31 inches at Nagar, and 11·78 at Umarkot, to 5·09 at Shikárpur, and 4·28 at Jacobábád.

In Madras the highest averages recorded are—135·60 inches at Cannanore; 131·91 at Mangalore; 125·63 at Tellicherri; 113·62 at Calicut; and 112·15 at Cochin—all on the west coast. The lowest falls recorded are—at Bellary, 16·06; Tuticorin (sheltered by the Gháts), 18·50; Guti (Gooty), 20·85; and Coimbatore, 20·90. All these stations lie low. The average fall at the stations on the east coast is about 41 inches. The average rainfall for Madras is 44 inches.

The rainfall along the coast of British Burmah is heavy, as might be expected, the following averages being recorded:—Sandoway, 218·58 inches; Tavoy, 195·47; Maulmain, 191·34; Akyab, 189·23; Khyouk-hpyu, 170·76. The smallest rainfall is at Thayet-myo (51·04) and Prome (59·46), sheltered by the Yoma range.

The rainfall at Port Blair, in the Andamans, is also naturally heavy, the average being returned as 116·25 inches.

Sun-spot Cycles.—The conclusions arrived at by the Indian meteorological department on the subject of the sun-spot cycles, which have been engaging the attention of scientific men, are thus summed up in the 1877 report:—"In conclusion, the following are the more important inferences that the meteorology of India in the years 1877 and 1878 appear to suggest, if not to establish. There is a tendency at the minimum sun-spot periods to prolonged excessive pressure over India, to an unusual development of the winter rains, and to the occurrence of abnormally heavy snowfall over the Himálayan region (to a greater extent probably in the western than the eastern Himálayas). This appears also to be usually accompanied by a weak Sun-spot cycles and rainfall.

south-west monsoon. The characteristics of a weak monsoon are—great irregularity in the distribution of the rainfall over the whole of India, and the occurrence of heavy local rainfalls, which tend, by a law of rainfall and of air-motion, to recur over the same limited areas. The irregularity of rainfall distribution is often shown by the persistent and prolonged absence of rain over considerable areas. These areas of drought and famine are partly marked off by nature, depending to a certain extent on the geographical features and position of the district. Thus the rains are more likely to fall below the amount necessary for cultivation in the dry region of the Deccan or in Upper India, than over the Malabar coast area or the province of Bengal."

Flora.

Flora.

Unlike many other large geographical areas, India is remarkable for having no distinctive botanical features peculiar to itself. It differs conspicuously in this respect from such countries as Australia or South Africa. Its vegetation is in point of fact of a composite character, and is constituted by the meeting and more or less blending of adjoining floras,—of those of Persia and the south-eastern Mediterranean area to the north-west, of Siberia to the north, of China to the east, and of Malaya to the south-east.

Our space does not admit of any minute discussion of the local features peculiar to separate districts, but regarded broadly, four tolerably distinct types present themselves.

Himálayas.

Himálayan.—The base of the Himálayas is occupied by a narrow belt forming an extreme north-western extension of the Malayan type described below. Above that there is a rich temperate flora which in the eastern chain may be regarded as forming an extension of that of northern China, gradually assuming westwards more and more of a European facies. *Magnolia*, *Aucuba*, *Abelia*, and *Skimmia* may be mentioned as examples of Chinese genera found in the eastern Himálayas, and the tea-tree grows wild in Assam. The same coniferous trees are common to both parts of the range. *Pinus longifolia* extends to the Hindu-Kush; *P. excelsa* is found universally except in Sikkim, and has its European analogue in *P. Peuce*, found in the mountains of Greece. *Abies smithiana* extends into Afghánistán; *Abies webbiana* forms dense forests at altitudes of 8000 to 12,000 feet, and ranges from Bhután to Kashmír; several junipers and the common yew (*Taxus baccata*) also occur. The deodar (*Cedrus Deodara*), which is indigenous to the mountains of Afghánistán and the north-west Himálaya, is nearly allied to the Atlantic cedar and to the cedar of Lebanon, a form of which has recently been found in Cyprus. A notable further instance of the connexion of the western Himálayan flora with that of Europe is the holm oak (*Quercus Ilex*), which is characteristic of the Mediterranean region.

The upper levels of the Himálayas slope northwards gradually to the Tibetan uplands, over which the Siberian temperate vegetation ranges. This is part of the great temperate flora which, with locally individualized species, but often with identical genera, ranges over the whole of the temperate zone of the northern hemisphere. In the western Himálayas this upland flora is marked by a strong admixture of European species, such as the columbine (*Aquilegia*) and hawthorn (*Cratægus Oxyacantha*). These disappear rapidly eastward, and are scarcely found beyond Kumáun.

North-west.

North-Western.—This is best marked in Sind and the Punjab, where the climate is very dry (the rainfall averaging less than 15 inches), and where the soil, though fertile, is wholly dependent on irrigation for its cultivation. The flora is a poor one in number of species, and is essentially identical with that of Persia, southern Arabia, and Egypt. The low scattered jungle contains such characteristic species as *Capparis aphylla*, *Acacia arabica* (babúl), *Populus euphratica* (the "willows" of Ps. cxxxvii. 2), *Salvadora persica* (erroneously identified by Royle with the mustard of Matt. xiii. 31), tamarisk, *Zizyphus*, *Lotus*, &c. More than nine-tenths of the Sind vegetation is estimated to be indigenous to Africa. The dry flora extends somewhat in a south-east direction, and then blends insensibly with that of the western peninsula; some species representing it are found in the upper Gangetic plain, and a few are widely distributed in dry parts of the country.

Ass and Ma pen sul.

Malayan.—This Sir Joseph Hooker describes as forming "the bulk of the flora of the perennially humid regions of India, as of the whole Malayan peninsula, the Upper Assam valley, the Khásí mountains, the forests of the base of the Himálaya from the Brahmaputra to Nepál, of the Malabar coast, and of Ceylon." It is not of course intended that over this wide and disjointed area there is an actual identity of species; but the affinities and general agreement of facies are sufficiently close to leave no doubt that they belong essentially to one and the same flora. A few illustrations must suffice:—pitcher-plants (*Nepenthes*), so richly developed in Borneo, occur at Singapore, on the Khásí mountains, and in Ceylon, while they are absent from the western peninsula; wood-oil trees (*Dipterocarpeæ*), which abound in the forests of the Malayan archipelago, are well represented by species individualized by isolation in the Malayan peninsula, Ceylon, and southern India; the gamboge of Singapore is scarcely distinguishable botanically from the Ceylon species; rubber-yielding trees are characteristic, such are the climbing *Apocynaceæ* found in the Malayan peninsula and Borneo, and the well-known *Ficus elastica*, indigenous to Assam and Java; numerous palms and several species of *Cycas* also distinguish this flora from that of the western peninsula. Teak (*Tectona grandis*), which is indigenous to the Malayan archipelago, is native to both peninsulas as far as 25° N. lat., and is more tolerant of a dry climate than most of its associates.

We Ind

Western Peninsula.—This type is difficult to characterize, and is in many respects intermediate between the two just preceding. It occupies a comparatively dry area, with a rainfall under 75 inches. In respect to positive affinities, Sir Joseph Hooker has pointed out some relations with the flora of tropical Africa as evidenced by the prevalence of such genera as *Grewia* and *Impatiens*, and the absence, common to both countries, of oaks and pines which abound in the Malayan archipelago. The annual vegetation which springs up in the rainy season includes numerous genera, such as *Sida* and *Indigofera*, which are largely represented both in Africa and Hindustán. Palms also in both countries are scanty, the most notable in southern India being the wild date (*Phœnix sylvestris*); *Borassus* and the cocoa-nut are cultivated. The forests, though occasionally very dense, as in the western Gháts, are usually drier and more open than those of the Malayan type, and are often scrubby. The most important timber trees are the toon (*Cedrela Toona*), sál (*Shorea robusta*), the present area of which forms two belts separated by the Gangetic plain, satin wood (*Chloroxylon Swietenia*), common in the drier parts of the peninsula, sandalwood, especially characteristic of Mysore, iron-wood (*Mesua ferrea*), and teak, which has already been alluded to.[1]

[1] For a general sketch of the flora of India recourse must still be had to the introductory essay to the *Flora Indica*, published by Hooker and Thomson in 1855. The *Flora of British India*, the preparation of which is (1881) in progress at Kew, will comprise brief descriptions of all the species known to science up to the date of publication. But although no complete analysis of the vegetation is yet possible, its general features are now tolerably well understood.

[For the above section on the Flora we are indebted to Mr W. T. T. Dyer of Kew.]

Wild Animals.

Mammals.—First among the wild animals of India must be mentioned the lion (*Felis leo*), which is known to have been not uncommon within historical times in Hindustán Proper and the Punjab. At present, the lion is supposed to be confined to the sandy deserts of Guzerat. A peculiar variety is there found, marked by the absence of a mane; but whether this variety deserves to be classed as a distinct species naturalists are not yet determined. The former extent of the lion's range, or at least the degree to which its presence impressed the imagination, may be inferred from the common personal names, Sinh or Sing, Sher, and Hyder, which all signify "lion." The characteristic beast of prey in India is the tiger (*F. tigris*), which is found in every part of the country from the slopes of the Himálayas to the Sundarban swamps. Sir Joseph Fayrer, the highest living authority on this subject, believes that 12 feet is the maximum length of the tiger, when measured from nose to tip of tail immediately after death. The advance of cultivation, even more than the incessant attacks of sportsmen, has gradually caused the tiger to become a rare animal in large tracts of country; but it is scarcely probable that he will ever be exterminated from India. The malarious *tarái* fringing the Himaláyas, the uninhabitable swamps of the Gangetic delta, and the wide jungles of the central plateau, are at present the chief home of the tiger. His favourite food appears to be deer, antelope, and wild hog. When these abound he will disregard domestic cattle. Indeed, the natives are disposed to consider him as in some sort their protector, as he saves their crops from destruction by the wild animals on which he feeds. But when once he develops a taste for human blood, then the slaughter he works becomes truly formidable. The confirmed man-eater, which is generally an old beast, disabled from overtaking his usual prey, seems to accumulate his tale of victims in sheer cruelty rather than for food. A single tiger is known to have killed 108 people in the course of three years. Another killed an average of about 80 persons per annum. A third caused thirteen villages to be abandoned, and 250 square miles of land to be thrown out of cultivation. A fourth, so late as 1869, killed 127 people, and stopped a public road for many weeks, until the opportune arrival of an English sportsman, who at last killed him. Such cases are, of course, exceptional, and generally refer to a period long past, but they explain and justify the superstitious awe with which the tiger is regarded by the natives. The favourite mode of shooting the tiger is from the back of elephants, or from elevated platforms (*macháns*) of boughs in the jungle. In Central India they are shot on foot. In Assam they are sometimes speared from boats, and in the Himálayas they are said to be ensnared by bird-lime. Rewards are given by Government to native *shikáris* for the heads of tigers, varying in time and place according to the need. In 1877, 819 persons and 16,137 cattle were reported to have been killed by tigers; on the other side of the account, 1579 tigers were reported slain, and £3777 was paid in rewards.

The leopard or panther (*F. pardus*) is far more common than the tiger in all parts of India, and at least equally destructive to life and property. The greatest length of the leopard is about 7 feet 6 inches. A black variety, as beautiful as it is rare, is sometimes found in the extreme south of the peninsula, and also in Java. The cheetah or hunting leopard (*Gueparda jubata*) must be carefully distinguished from the leopard proper. This animal appears to be a native only of the Deccan, where it is trained for hunting the antelope. In some respects it approaches the dog more nearly than the cat tribe. Its limbs are long, its hair rough, and its claws blunt and only partially retractile. The speed with which it bounds upon its prey, when loosed from the cart, exceeds the swiftness of any other mammal. If it misses its first attack, it scarcely ever attempts to follow, but returns to its master. Among other species of the family *Felidæ* found in India may be mentioned the ounce or snow leopard (*F. uncia*), the clouded tiger (*F. macroscelis*), the marbled tiger cat (*F. marmorata*), the jungle cat (*F. chaus*) and the common viverrine cat (*F. viverrina*).

Wolf tribe.

Wolves (*Canis lupus*) abound throughout the open country, but are rare in the wooded districts. Their favourite prey is sheep, but they are also said to run down antelopes and hares, or rather catch them by lying in ambush. Instances of their attacking man are not uncommon. In 1827 upwards of thirty children were carried off by wolves in a single *parganá*; and the story of Romulus and Remus has had its counterpart in India within recent times. The Indian wolf has a dingy reddish-white fur, some of the hairs being tipped with black. By some naturalists it is regarded as a distinct species, under the name of *Canis pallipes*. Three distinct varieties, the white, the red, and the black wolf, are found in the Tibetan Himálayas. The Indian fox (*Vulpes bengalensis*) is comparatively rare, but the jackal (*C. aureus*) abounds everywhere, making night hideous by its never-to-be-forgotten yells. The jackal, and not the fox, is usually the animal hunted by the packs of hounds occasionally kept by Europeans. The wild dog or dhole (*C. dhola*) is found in all the wilder jungles of India, including Assam and British Burmah. Its characteristic is that it hunts in packs, sometimes containing thirty dogs, and does not give tongue. When once a pack of wild dogs has put up any animal, whether deer or tiger, that animal's doom is sealed. They do not leave it for days, and finally bring it to bay, or run it down exhausted. These wild dogs have sometimes been half domesticated, and trained to hunt for the use of man. A peculiar variety of wild dog exists in the Karen hills of Burmah, thus described from a specimen in confinement. It was black and white, as hairy as a skye-terrier, and as large as a medium-sized spaniel. It had an invariable habit of digging a hole in the ground, into which it crawled backwards, remaining there all day with only its nose and ferrety eyes visible. Among other dogs of India are the pariah, which is merely a mongrel, run wild and half starved; the poligar dog, an immense creature peculiar to the south; the grey-hound, used for coursing; and the mastiff of Tibet and Bhután. The striped hyæna (*Hyæna striata*) is common, being found wherever the wolf is absent. Like the wolf, it is very destructive both to the flocks and to children.

Dog.

Bear.

Of bears, the common black or sloth bear (*Ursus labiatus*) is common throughout India wherever rocky hills and forests occur. It is distinguished by a white horse-shoe mark on its breast. Its food consists of ants, honey, and fruit. When disturbed it will attack man, and it is a dangerous antagonist, for it always strikes at the face. The Himálayan or Tibetan sun bear (*U. tibetanus*) is found along the north, from the Punjab to Assam. During the summer it remains high up in the mountains, near the limit of snow, but in the winter it descends to 5000 feet and even lower. Its congener, the Malayan sun bear (*Helarctos malayanus*), is found in British Burmah, where also there is a smaller species (*H. euryspilus*), and a very large animal reported to be as big as the American grizzly.

Elephant.

The elephant (*Elephas indicus*) is found in many parts of India, though not in the north-west. Contrary to what might be anticipated from its size and from the habits of its African cousin, the Indian elephant is now, at any rate, an inhabitant, not of the plains, but of the hills; and even on the hills it is usually found among the higher ridges and plateaus, and not in the valleys. From the peninsula of

India the elephant has been gradually exterminated, being only found now in the primæval forests of Coorg, Mysore, and Travancore, and in the tributary states of Orissa. It still exists in considerable number along the *tarái* or submontane fringe of the Himálayas. The main source of supply at the present time is the confused mass of hills which forms the north-east boundary of British India, from Assam to Burmah. Two varieties are there distinguished, the *gunda* or tusker, and the *makna* or *hine*, which has no tusks. The reports of the height of the elephant, like those of its intelligence, seem to be exaggerated. The maximum is probably 12 feet. If hunted, the elephant must be attacked on foot, and the sport is therefore dangerous, especially as the animal has but few parts vulnerable to a bullet. The regular mode of catching elephants is by means of a *kheda* or gigantic stockade, into which a wild herd is driven, then starved into submission, and tamed by animals already domesticated. The practice of capturing them in pitfalls is discouraged as cruel and wasteful. Elephants now form a Government monopoly everywhere in India. The shooting of them is prohibited, except when they become dangerous to man or destructive to the crops; and the right of capturing them is only leased out upon conditions. A special law, under the title of "The Elephants Preservation Act" (No. VI. of 1879), regulates this licensing system. Whoever kills, captures, or injures an elephant, or attempts to do so, without a licence, is punishable by a fine of 500 rupees for the first offence; and a similar fine, together with six months' imprisonment, for a second offence. In the year 1877–78 a total of two hundred and sixty-four elephants were captured in the province of Assam, yielding to Government a revenue of £3600. In the season of 1873–74 no less than fifty-three were captured at one time by Mr Sanderson, the superintendent of the Kheda Department in Mysore, who has made a special study of the Indian elephant, as Sir S. Baker has of the same animal in Ceylon. Though the supply is decreasing, elephants continue to be in great demand. Their chief use is in the timber trade, and for Government transport. They are also bought up by native chiefs at high prices for purposes of ostentation.

Rhinoceros. Of the rhinoceros, four distinct varieties are enumerated, two with a single and two with a double horn. The most familiar is the *Rhinoceros unicornis*, commonly found in the Brahmaputra valley and in the Sundarbans. It has but one horn, and is covered with massive folds of naked skin. It sometimes attains a height of 6 feet; its horn, which is much prized by the natives for medicinal purposes, seldom exceeds 14 inches in length. It frequents swampy, shady spots, and wallows in mud like a pig. The inveterate antipathy of the rhinoceros to the elephant seems to be mythical. The Javan rhinoceros (*R. sondaicus*) is found in the same localities. It also has but one horn, and mainly differs from the foregoing in being smaller, and having less prominent "shields." The Sumatran rhinoceros (*R. sumatrensis*) is found from Chittagong southwards through Burmah. It has two horns and a bristly coat. The hairy-eared rhinoceros (*R. lasiotis*) is only known from a specimen captured at Chittagong.

Wild hog. The wild hog (*Sus scrofa*, var. *indica*) is well known as affording the most exciting sport in the world—"pig-sticking." It frequents cultivated situations, and is the most mischievous enemy of the villager. A rare animal, called the pigmy hog (*Porculia salviania*), exists in the *tarái* of Nepál and Sikkim, and has been shot in Assam. Its height is only 10 inches, and its weight does not exceed 12 lb.

Wild ass. The wild ass (*Asinus onager*) is confined to the sandy deserts of Sind and Kachhch (Cutch), where, from its speed and timidity, it is almost unapproachable.

Many wild species of the sheep and goat tribe are to be found in the Himálayan ranges. The *Ovis ammon* and *O. poli* are Tibetan rather than Indian species. The *urial* and the *shapu* are kindred species of wild sheep, found respectively in Ladákh and the Suláimán range. The former comes down to 2000 feet above the sea, the latter is never seen at altitudes lower than 12,000 feet. The *barhal*, or blue wild sheep, and the *markhur* and *tahr* (both wild goats) also inhabit the Himálayas. A variety of the ibex is also found there, as well as in the highest ranges of southern India. The *sarau* (*Nemorhædus rubida*), allied to the chamois, has a wide range in the mountains of the north, from the Himálayas to Assam and Burmah.

The antelope tribe is represented by comparatively few species, as compared with the great number peculiar to Africa. The antelope proper (*Antilope bezoartica*), the "black buck" of sportsmen, is very generally distributed. Its special habitat is salt plains, as on the coast-line of Guzerat and Orissa, where herds of fifty does may be seen, accompanied by a single buck. The doe is of a light fawn colour, and has no horns. The colour of the buck is a deep brown-black above, sharply marked off from the white of the belly. His spiral horns, twisted for three or four turns like a corkscrew, often reach the length of 30 inches. The flesh is dry and unsavoury, but is permitted meat for Hindus, even of the Bráhman caste. The *nílgai* or blue cow (*Portax picta*) is also widely distributed, but specially abounds in Hindustan Proper and Guzerat. As with the antelope, the male alone has the dark blue colour. The *nílgai* is held peculiarly sacred by Hindus, from its fancied kinship to the cow, and on this account its destructive inroads upon the crops are tolerated. The four-horned antelope (*Tetraceros quadricornis*) and the gazelle (*Gazella bennetti*) are also found in India. The *chiru* (*Pantholops hodgsoni*) is confined to the Himálayan plateaus.

The king of the deer tribe is the *sámbhar* or *gerau* (*Rusa aristotelis*), erroneously called "elk" by sportsmen. It is found on the forest-clad hills in all parts of the country. It is of a deep-brown colour, with hair on its neck almost like a mane; and it stands nearly 5 feet high, with spreading antlers nearly 3 feet in length. Next in size is the swamp deer or *bara-singha*, signifying "twelve points" (*Rucervus duvaucelli*), which is common in Lower Bengal and Assam. The *chitál* or spotted deer (*Axis maculata*) is generally admitted to be the most beautiful inhabitant of the Indian jungles. Other species include the hog deer (*Cervus porcinus*), the barking deer or muntjac (*Cervulus vaginalis*), and the mouse deer (*Meminna indica*). The musk deer (*Moschus moschiferus*) is confined to Tibet.

The ox tribe is represented in India by some of its noblest species. The *gaur* (*Bibos gaurus*), the "bison" of sportsmen, is found in all the hill jungles of the country, in the Western Gháts, in Central India, in Assam, and in British Burmah. This animal sometimes attains the height of 20 hands (close on 7 feet), measuring from the hump above the shoulder. Its short curved horns and skull are enormously massive. Its colour is dark chestnut, or coffee-brown. From the difficult nature of its habitat, and from the ferocity with which it charges an enemy, the pursuit of the bison is no less dangerous and no less exciting than that of the tiger or the elephant. Akin to the *gaur*, though not identical, are the *gayál* or *mithan* (*B. frontalis*), confined to the hills of the north-east frontier, where it is domesticated for sacrificial purposes by the aboriginal tribes, and the *tsine* or *banting* (*B. sondaicus*), found in Burmah. The wild buffalo (*Bubalus arni*) differs from the tame buffalo only in being larger and more fierce. The finest specimens come from Assam and Burmah. The horns of the bull are thicker than those of the cow, but the horns of the cow are larger. A head has been known to measure 13 feet 6 inches in circumference, and 6 feet 6 inches between the tips. The greatest height is 6 feet. The colour is a slaty black; the hide is immensely thick, with scanty hairs. Alone perhaps of all wild animals in India, the buffalo will charge unprovoked. Even tame buffaloes seem to have an inveterate dislike to Europeans.

The rat and mouse family is only too numerous. Conspicuous in it is the loathsome bandicoot (*Mus bandicota*), which sometimes measures 2 feet in length, including its tail, and weighs 3 lb. It burrows under houses, and is very destructive to plants, fruit, and even poultry. More interesting is the tree rat (*M. arboreus*), a native of Bengal, about 7 inches long, which makes its nest in cocoa-nut palms and bamboos. The voles or field mice (genus *Arvicola*) occasionally multiply so exceedingly as to diminish the out-turn of the local harvest, and to require special measures to be organized for their suppression.

ls. *Birds.*—The ornithology of India, though it is not considered so rich in specimens of gorgeous and variegated plumage as that of other tropical regions, contains many splendid and curious varieties. Some are clothed in nature's gay attire, others distinguished by strength, size, and fierceness. The parrot tribe is the most remarkable for beauty. So various are the species that we cannot even enumerate them, and must refer for details to the scientific works on the subject.[1] Among birds of prey, four vultures are found, including the common scavengers (*Gyps indicus* and *G. bengalensis*). The eagles comprise many species, but none to surpass the golden eagle of Europe. Of falcons, there are the peregrine (*F. peregrinus*), the *shain* (*F. peregrinator*), and the *lagar* (*F. jugger*), which are all trained by the natives for hawking; of hawks, the *shikara* (*Astur badius*), the sparrow hawk (*Accipiter nisus*), and the crested goshawk (*Astur trivirgatus*). Kingfishers of various kinds, and herons are sought for their plumage. No bird is more popular with natives than the *maina* (*Acridotheres tristis*), a member of the starling family, which lives contentedly in a cage, and can be taught to pronounce the name of Krishna. Water-fowl are especially numerous. Of game-birds, the floriken (*Sypheotides auritus*) is valued as much for its rarity as for the delicacy of its flesh. Snipe (*Gallinago scolopacina*) abound at certain seasons, in such numbers that one gun has been known to make a bag of eighty brace in a day. Pigeons, partridges, quail, plover, duck, teal, sheldrake, widgeon—all of many varieties—complete the list of small game. The red jungle fowl (*Gallus ferruginesis*), supposed to be the ancestor of our own poultry, is not good eating; and the same may be said of the peacock (*Pavo cristatus*), except when young. The pheasant does not occur in India Proper, though a white variety is found in Burmah.

tiles. *Reptiles.*—The serpent tribe in India is numerous; they swarm in all the gardens, and intrude into the dwellings of the inhabitants, especially in the rainy season. Most are comparatively harmless, but the bite of others is speedily fatal.[2] The cobra di capello (*Naga tripudians*)—the name given to it by the Portuguese, from the appearance of a hood which it produces by the expanded skin about the neck—is the most dreaded. It seldom exceeds 3 or 4 feet in length, and is about an inch and a quarter thick, with a small head, covered on the forepart with large smooth scales; it is of a pale brown colour above, and the belly is of a bluish-white tinged with pale brown or yellow. The Russelian snake (*Daboia russellii*), about 4 feet in length, is of a pale yellowish brown, beautifully variegated with large oval spots of deep brown, with a white edging. Its bite is extremely fatal. Itinerant showmen carry about these serpents, and cause them to assume a dancing motion for the amusement of the spectators. They also give out that they render snakes harmless by the use of charms or music,—in reality it is by extracting the venomous fangs. But, judging from the frequent accidents which occur, they sometimes dispense with this precaution. All the salt-water snakes in India are poisonous, while the freshwater forms are wholly innocuous. Sir J. Fayrer has demonstrated that there is no cure for the bite of the cobra, if the snake is full-grown, and if its poison fang is full and is not interfered with by clothing. The most hopeful remedy in all cases of snake bite is the injection of ammonia. The loss of life from this cause in India is painful to contemplate, nor does any means of diminishing the evil seem feasible. It is impossible to exterminate poisonous snakes altogether, even in England. In India the impossibility is yet more evident, from the greater number of the snakes, the character of the country, and the scruples of the people. Something, however, is being effected by the offer of rewards. In 1877 a total of 16,777 persons are reported to have been killed by snakes, as compared with only 819 by tigers. In the same year, rewards to the amount of £811 were given for the destruction of 127,295 snakes.

The other reptiles include two varieties of crocodile (*C. porosus* and *C. biporcatus*) and the gavial (*Gavialis gangeticus*). These are more ugly in appearance than destructive to human life. Scorpions also abound.

Fishes.—All the waters of India—the sea, the rivers, and the tanks—swarm with a great variety of fishes, which are caught in every conceivable way, and furnish a considerable proportion of the food of the poorer classes. They are eaten fresh, or as nearly fresh as may be, for the art of curing them is not generally practised, owing to the exigencies of the salt monopoly. In Burmah the favourite relish of *nga-pi* is prepared from fish; and at Goálandá, at the junction of the Brahmaputra with the Ganges, an important station has recently been established for salting fish in bond. The indiscriminate slaughter of fry, and the obstacles opposed by irrigation dams to breeding fish, are said to be causing a sensible diminution in the supply in certain rivers. Measures of conservancy have been suggested, but their execution would be almost impracticable. Among Indian fishes, the *Cyprinidæ* or carp family and the *Siluridæ* or cat-fishes are best represented. From the angler's point of view, by far the finest fish is the *mahsir*, found in all hill streams, whether in Assam, the Punjab, or the South. One has been caught weighing 60 lb, which gave play for more than seven hours. Though called the salmon of India, the *mahsir* is really a species of barbel. The most recent authority on Indian fishes and their economic aspects is Dr Francis Day. Fishes.

In this connexion may be mentioned the *susu* or Gangetic dolphin (*Platanista gangetica*), which is often erroneously called a porpoise. Both the structure and habits of this animal are very singular. It measures from 6 to 12 feet in length, and in colour is sooty-black. Its head is globular, with a long, narrow, spoon-shaped snout. Its eyes are rudimentary, like those of the mole; and its ear-orifices are no bigger than pin-holes. Its dentition, also, is altogether abnormal. It frequents the Ganges and Indus from their mouths right up to their tributaries within the hills. A specimen has been taken at least 1000 miles above Calcutta. Ordinarily its movements are slow, for it wallows in the muddy bed of the river, and but rarely comes to the surface to blow. The *susu* belongs to the order *Cetacea*; and inquiries have recently been directed to the point whether its blubber might not be utilized in commerce.

Insects.—The insect tribes in India may be truly said to be innumerable; nor has anything like a complete classification been given of them in the most scientific treatises. Insects.

[1] See especially Jerdon and Gould.

[2] See Sir J. Fayrer's *Thanatophidia*

The heat and the rains give incredible activity to noxious or troublesome insects, and to others of a more showy class, whose large wings surpass in brilliancy the most splendid colours of art. Stinging musquitoes are innumerable, and moths and ants of the most destructive kind, as well as others equally noxious and disagreeable. Amongst those which are useful are the bee, the silk-worm, and the insect that produces lac. Clouds of locusts occasionally appear, which leave no trace of green behind them, and give the country over which they pass the appearance of a desert. Dr Buchanan saw a mass of these insects in his journey from Madras to the Mysore territory, about 3 miles in length, like a long narrow red cloud near the horizon, and making a noise somewhat resembling that of a cataract. Their size was about that of a man's finger, and their colour reddish. They are swept north by the wind till they strike upon the outer ranges of the Himálayas.

The People.

Population. The population of India, with British Burmah, amounts to 240 millions, or, as already mentioned, exactly double the number which Gibbon estimated for the Roman empire in the height of its power. But the English Government, like the Roman, has respected the rights of native chiefs who are willing to govern peaceably and well, and one-third of the country still remains in the hands of hereditary rulers. Their subjects (including Mysore) make up 54 millions, or over one-fifth of the whole Indian people. The British territories (including Mysore, temporarily under British administration), therefore comprise only two-thirds of the area of India, and less than four-fifths, or 191 millions, of its inhabitants.

Census. For the first time in the history of India an attempt was made in the years 1871–72 to ascertain the population of the country by actual counting. The results obtained on that occasion, though in certain points they leave much to be desired, may be accepted generally as a tolerable approximation to the truth. Prior to this census, occasional enumerations had been made, with varying degrees of accuracy, in some of the provinces; while in others mere conjectural estimates had been allowed to pass uncriticized. In Bengal, for example, where statistical inquiry was in a backward state, the Government had year by year accepted a loose estimate of 42 millions for the population under its control, and based upon this all its calculations for legislation and finance. The census of 1872 disclosed a total of nearly 67 millions for Bengal and Assam, being an increase upon the estimate of more than one-half. In Berar, or the Assigned Districts of Hyderabad, a census had been taken in 1867, in the Punjab in 1868, and in Oudh in 1869. In these provinces, therefore, it was considered impolitic to trouble the people by a fresh enumeration. Throughout all the rest of India under British administration, including the native state of Mysore, a general census was effected on uniform principles, which may be said to have begun in November 1871 and ended in August 1872. So far as possible, the work was done in a single night; but in certain remote and uncivilized tracts it was of necessity prolonged over several months. Considering the absolute novelty of the undertaking, at least in some provinces, and the scanty means at the disposal of the authorities, the general accuracy of the results may be regarded with not a little satisfaction. Subsequent local investigations tend to show that the numbers were under rather than overstated. In a few cases paid enumerators were engaged; but generally the work was left to the ordinary staff of each district, assisted by the police, the landlords, and their agents. The total expenditure throughout all British India was only £82,203, being at the rate of less than half a farthing per head. The suspicions of the ignorant villagers were naturally aroused by the counting, which they imagined to be preliminary to some fresh exaction by the Sarkár or Government. Only in two or three cases was any real opposition offered; and there is little reason to believe that any material evasion was accomplished.

Gen[eral] resu[lts]. The total population of British India was ascertained to amount to 191,096,603 persons, on an area of 898,381 square miles, being an average of 212 persons per square mile. Deducting the frontier province of Assam and British Burmah beyond the sea, the average is 243 persons per square mile. The population of the several native states is returned, partly from actual enumeration and partly from mere guessing, at 49,155,746 persons, on an area of 575,265 square miles, being an average of 85 persons to the square mile. The French possessions have an area of 178 square miles and a population of 271,460 persons; the Portuguese possessions, 1086 square miles and 407,712 persons. The aggregate figures for all India, therefore, are 1,474,910 square miles and 240,931,521 persons, or an average of 163 persons per square mile.

The following tables exhibit the results of the census of 1872 in a tabular form, arranged according to provinces and aggregates of native states, as presented to Parliament in 1879 in the *Statistical Abstract for British India*, No. XIII. for 1877–78. For certain details the Memorandum on the Census of 1872 presented to Parliament in 1875 has been used. No really important changes in the returns will be made till the next census, but slight alterations or adjustments are from time to time effected.

Total	575,265	49,155,746	85

1 Mysore will be handed back in 1881 to the administration of its native rájá.
2 Oudh is incorporated for most purposes with the N.W. Provinces.
3 The area of the wild country in which the population is not reckoned has been excluded in calculating these averages.

Total Area and Population of All India.

	Area in Sq. Miles.	Population.	Density per Sq. Mile.
Under British administration	898,381	191,096,603	212
Native States	575,265	49,155,746	85
Portuguese Possessions	1,086	407,712	chiefly
French Possessions	178	271,460	in towns.
Grand total	1,474,910	240,931,521	163

ısity ·opu- on. According to the report of the registrar-general upon the English census of 1871, "any density of a large country approaching 200 to a square mile implies mines, manufactures, or the industry of cities." But in India a density of thrice this limit, or 600 to the square mile, is often attained throughout large districts which are entirely dependent upon agriculture. Sáran, for example, in North Behar, with an area of 2654 square miles and no town exceeding 50,000 inhabitants, has an average density of 778 to the square mile, with a maximum of 984 in the purely agricultural *thâná* or police circle of Mashrak. Taking the valley of the Ganges as a whole, from Saháranpur down to Calcutta, the average density is about 500 to the square mile, or nearly double that of the United Kingdom.

ıan ula- This high density is obtained without the presence of many large towns or centres of manufacturing life. Of the total number of 493,444 towns and villages in British India, only 44 are returned as having more than 50,000 inhabitants, 374 as having from 10,000 to 50,000, and 1070 as having from 5000 to 10,000. The 44 towns with more than 50,000 inhabitants have an aggregate urban population of a little more than 5½ millions, or less than 3 per cent. of the total population of British India; whereas the 34 towns in England and Wales exceeding the same limit have an aggregate urban population of nearly 7½ millions, or 32 per cent. of the total. Taking a lower limit, there are 139 towns in British India with more than 20,000 inhabitants, having an aggregate of 8,484,066, or less than 4½ per cent. of the total.

Towns with more than 100,000 *Inhabitants.*

Calcutta[1]	776,579	Bangalore	142,513
Bombay[2]	644,405	Amritsar	142,381
Madras[2]	397,552	Lahore[2]	128,441
Lucknow	284,779	Cawnpur	122,770

Allahábád	143,693	Bareilly	102,982

ted ses. The total number of inhabited houses enumerated in British India is 37,041,259. The average number of houses per square mile is 41, ranging from 102 in Oudh to 6 in British Burmah. The average number of persons per house is 5·15, being pretty uniform throughout. Contrary to the experience of the United Kingdom it is found that the number of inmates to each house is lower in the towns than in the country, the reason assigned being that the shopkeepers do not bring their families into the towns with them. The houses are grouped into a total of 493,444 villages or townships, giving an average of 75 houses and 386 persons to each. The average area of each village or township is ·55 of a square mile. The villages seem to be largest in Bombay, with 614 inhabitants each, and smallest in British Burmah, with 195 inhabitants.

and s Out of the total of 191,096,603 persons in British India, 98,055,381 are returned as males and 92,580,886 as females, leaving 460,336 of whom the sex was unspecified. The proportion of males to females is thus as 100 to 94. In England the females outnumber the males in the proportion of 105 to 100, an excess attributed mainly to emigration. In India, whence there is practically no emigration, it might be expected that this excess of females would disappear, and the two sexes be found on an equality. In the two great provinces of Bengal and Madras this is practically the case, the excess of females being not greater than 1 per cent., and the proportion being maintained uniformly throughout the districts. But in Oudh the excess of males is 7 per cent., in Bombay 8 per cent., in the North-Western Provinces 12 per cent., and in the Punjab as high as 16 per cent. We have no reason to suppose that the approximate equality of boys and girls does not hold good in the births throughout India, as in other countries; and therefore this great excess of males can only be assigned to two causes—(1) defective registration of females, especially of girls, and (2) female infanticide formerly, and carelessness of infant female life at the present day. Of the existence of these causes we possess independent testimony. In 1870 an act of the legislature was passed applying special regulations to villages or tracts suspected of infanticide, which is the besetting sin of certain high caste tribes of Rájputs. In one tribe of Meerut district only 8 girls under 12 were found to 80 boys. The act is put in force wherever there are less than 54 girls to 100 boys, but the exact limit is at the discretion of Government. The crime is now almost stamped out.

The returns according to age throw some light upon this question. Children under 12 number altogether 66,969,764, and adults above 12 number 123,200,022, leaving 926,817 unspecified. The proportion of children to adults is, therefore, as 54 to 100, the corresponding proportion in England being 41 to 100. The highest proportion of children (62 to 100) is found in the Central Provinces, where the aboriginal tribes are strongest; and the lowest proportion (50 to 100) in the North-Western Provinces. An examination of the Bengal returns, district by district, also leads to the conclusion that the aboriginal tribes are more prolific than the Hindus proper. Subdividing these returns according to sex, we discover an extraordinary disparity. Of the adults, 62,022,461 are males and 61,197,561 are females. The proportion of male adults to females is, therefore, about 100 to 99, as compared with 100 males to 94 females in the general population. But on turning to the children under 12, we find as many as 35,787,564 boys to only 31,182,200 girls, or 100 boys to only 87 girls. This arises from the defective registration of girls, females under 12 being often returned as women.

The following table shows the population of British India as roughly subdivided according to religion. Broadly speaking, it may be said that at least nineteen out of every twenty people in India are either Hindus or Mahometans, and that there are seven of the former to two of the latter. Religious division.

Population according to Religion in British India.

Religion.	Number.	Per cent.	Tracts where most numerous.
Hindus	139,343,820	73·07	South; and Upper Valley of Ganges.
Mahometans	40,867,125	21·45	Sind, Punjab, Eastern Bengal, and North-West Provinces.
Buddhist and Jains	2,832,851	1·49	British Burmah only.
Sikhs	1,174,436	·62	Punjab only.
Christians	897,682	·47	Extreme South.
Others[3]	5,417,304	2·68	Central Provinces and Bombay.
Unspecified	561,069	·22	

The schedules of the census fail entirely to give a satisfactory classification of the races among which the vast population of India is divided. Using language as our criterion, the people might perhaps be arranged in five classes:—(1) The old races of the south, known as the Dravidian stock, which includes, not only the great peoples using the literary languages of Tamil, Telugu, Malayálam, and Kanarese, but also scattered tribes speaking dialects of the same family, who are found as far north as the hills of Chutiá Nágpur; (2) the hill tribes of Central India, from the Bhíls of Bombay to the Santáls of Bengal, whose physical characteristics are negroid, and whose family of languages has received the name of Kolarian; (3) the tribes of Indo-Chinese origin, who inhabit the southern slopes of the Himálayas, the greater part of the Assam valley, and the whole of Burmah;—it seems probable that the semi-Hinduized low castes of Northern Bengal also belong to this stock; (4) high-caste Hindus, or that offshoot of the august Aryan race which has imposed its language, its religion, and its name upon the greater part of the country; (5) successive waves of Mahometan conquerors, Arab, Afghán, Mughal, and Persian, who form in the aggregate but an infinitesimal element in the general population. Whether pure Aryans are now to be traced in any other class than that of the Bráhmans Ethnical division.

[1] With suburbs, but excluding Howrah. [2] With suburbs.

[3] Professing for the most part various forms of aboriginal belief.

may perhaps be disputed. Even the so-called Rájputs have probably a considerable admixture of Scythic blood. The Vaisya or third caste of Manu's system is admitted to be almost extinct, while his Súdras are to be found in the pre-existing non-Aryan population.

Principal Divisions of the Population.

Race, &c.	Number.	Tracts where most numerous.
Hindus.		
Bráhmans	10,131,541	N.-W. Provinces, Oudh, Bengal, Madras.
Rájputs	5,641,138	N.-W. Provinces, Bengal, Oudh, Punjab.
Out-castes	8,712,998	Madras.
Aboriginal tribes	17,716,825	Bengal, Central Provinces, Assam.
Native Christians	595,815	South and West.
Mahometans.		
Mughals	219,755	Punjab.
Afgháns or Patháns	1,841,693	Do.
Sayyids	790,984	
Shaikhs	4,700,320	
Foreigners.		
Pársís	69,000	Bombay city and Surat.
Nepális	31,000	Bengal.
Manipuris	12,000	Assam.
Arabs	8,300	Bombay.
Persians	3,500	Do.
Armenians	1,250	Bengal.
Chinese	13,300	Burmah.
Malays	1,500	Do.
Jews	7,600	Bombay.
Eurasians and Indo-Portuguese	108,000	Calcutta, Madras, and Bombay cities.
Europeans	121,000	of whom 75,700 are British.

Mahometans. Among Mahometans, who number in all 40,227,552, four classes are commonly distinguished. *Mughals*, or the descendants of the last conquering race, number only 219,755, of whom nearly half are to be found in the Punjab. *Afgháns* or *Patháns* on the other hand, from their proximity to the frontier, are much more strongly represented, numbering 1,841,693 in all, chiefly in the Punjab and in the Rohilkhand division of the North-West. *Sayyids*, who claim to be lineally descended from the prophet, number 790,984; and *Shaikhs*, 4,700,320. The remainder are unspecified, but the following tribes or classes among Indian Musalmáns are worthy of notice. In Bengal the vast majority of the Mahometans manifestly belong to the same race as the lowest castes of Hindus. They are themselves subdivided into many classes, which in their devotion to hereditary occupations are scarcely to be distinguished from Hindu castes. Of late years a reforming spirit has arisen, leading them to abandon the polytheistic customs and festivals which they shared with their Hindu fellow-villagers. In the Punjab, besides the Pathán immigrants from across the frontier, Islam has taken a strong hold of the native population. The census returned upwards of 1,300,000 Játs, 700,000 Rájputs, and 424,000 Gujars among the Musalmáns. Here, again, the Mahometans are not strongly distinguished from their Hindu brethren. Baluchis from beyond the frontier number 235,000 in the Punjab, and 145,000 in Sind. Bombay possesses three peculiar classes of Musalmáns, each of which is specially devoted to maritime trade,—the *Memons*, numbering 49,000, chiefly in Sind; the *Borahs*, 86,000, mainly in Guzerat; the *Khojahs*, nearly 18,000, of whom half live in the island of Bombay. In southern India the majority are known as Dakhani Musalmáns, being descendants of the armies led by the kings and nawábs of the Deccan. But the two peculiar races of the south are the *Moplas* (613,000) and the *Labbays* (312,000), both of which are seated along the coast and follow a seafaring life. They are descended from the Arab traders who settled there in very early times, and have been recruited partly by voluntary adhesions and partly by forcible conversions during the persecutions of Hyder Alí and Tipú Sultán. The Moplas of Malabar are notorious for repeated outbreaks of bloody fanaticism.

The Mahometans are most numerous, as might be expected, along the valley of the Indus, from Karáchi (Kurrachee) to Peshawar. In the Bombay province of Sind they number 78 per cent. of the total population. In the Punjab generally the proportion is 53 per cent., rising to 93 per cent. in the frontier district of Peshawar. In the North-Western Provinces and also in Oudh the proportion of Mahometans nowhere exceeds 23 per cent., though that part of the country was the seat of successive Musalmán empires for many centuries. In Lower Bengal, on the other hand, the faith of Islam has exercised a more permanent effect upon the population, especially in the valley of the Brahmaputra. The average of Mahometans in the whole province is 33 per cent., rising to 80 per cent. in the deltaic districts of Bográ and Rájsháhí. Here, again, it is found that the Mahometans are not most numerous in the neighbourhood of the great Musalmán capitals, Gaur, Rájmahál, Dacca, and Murshidábád, but in the densely populated agricultural tracts, where the semi-aboriginal tribes appear to have willingly embraced Islam in preference to remaining outcasts beyond the exclusive pale of Hinduism.

Sikhs. The Síkhs are almost entirely confined to the Punjab, where they number only 6·50 per cent. of the population. Their stronghold is the country between the rivers Rávi and Sutlej (Satlaj), including the historical cities of Lahore, Amritsar, Ambála (Umballa), and Jalandhar. In no district do they form more than 17 per cent.

Christians. Of the total number of 897,682 Christians, about 250,000 are believed to be Europeans or to have European blood in their veins. The south of India is the only part where the exertions of the missionaries can be said to be visible in the statistics of population. In the Madras presidency generally, Christians number 533,760, or 1·71 per cent. of the total. Of these, about 416,000 are returned as Roman Catholics, and about 118,000 as Protestants. Nearly one-fifth of all the Christians are found in the single district of Tinnevelli, and they are numerically next strongest in Madura, Tanjore, Trichinopoli, South Kánara, and Malabar. Christianity has been known in southern India for many centuries. A Pehlevi inscription in the ancient church of the St Thomas' Mount near Madras city indicates a settlement of Manichæans or Persian Christians on the eastern coast, as well as on the west; and tradition speaks of the preaching of the apostle St Thomas in Madras, Tinnevelli, and Malabar. The adherents of the Syrian church in Malabar, Travancore, and Cochin are the most ancient Christian community in the south. After these come the Roman Catholics, who trace their origin to the teaching of St Xavier and the Madura Jesuits. The Protestant churches date only from about the beginning of the present century, but their progress since that time has been considerable. In Bombay there are 126,063 Christians, of whom nearly 83,000, chiefly Indo-Portuguese, are returned as Roman Catholics. In Bengal the Christians number only 90,763, but since the date of the census missionary effort has been very successful among the hill tribes of Chutiá Nágpur. In the North-Western Provinces there are 22,196 Christians, in the Punjab 22,154, in the Central Provinces 10,477, in Mysore 25,676, in Coorg 2410, and the remainder are scattered over Assam, Berar, and Ajmír. In British Burmah the Christians are proportionately more numerous than in any other province, amounting to 52,299, or 1·90 per cent., chiefly converts from the hill tribe of Karens. It should be remembered that the above figures are exclusive of the native states, in which the Christians amount to about 700,000, making a total in round numbers of 1½ millions for all India.

Occupations. An attempt was made at the time of the census to ascertain the professions and occupations of the male adults, but the results cannot be accepted as even approximately accurate. The totals, however, are here given for what they may be worth. Out of a classified total of about 62,000,000 adult males, 2,232,000, or 3·6 per cent., were returned as professional or in Government service; 3,844,000, or 6·2 per cent., as in domestic service; 34,844,000, or 56·2 per cent., as agricultural; 3,224,000, or 5·2 per cent., as commercial; 8,122,000, or 13·1 per cent., as industrial; 7,626,000, or 12·3 per cent., as labourers; and 2,108,000, or 3·4 per cent., as independent and non-productive.

ecific firmi- s. An attempt was also made to collect statistics of persons afflicted with certain specific infirmities, but here again the results possess little value. The number of insane persons and idiots was returned at 67,000, or 1 in 2700 of the population, being less than ⅓th of the rate prevailing in England. The deaf and dumb numbered 134,000, or 1 in 1340, a proportion about half as great again as in England; the blind numbered 354,000, or rather less than 1 in 500, which is double the English rate; the lepers numbered 96,000, or 1 in 1875.

al sta- ics. Returns of both births and deaths are now regularly collected over almost the entire area under British administration. In towns the returns are furnished through the municipalities, while in the rural tracts the agency employed is the police. The figures thus obtained are for the most part so evidently inadequate that it would only be misleading to reproduce them in this place. Suffice it to say that the sanitary commissioner accepts as approximately correct a calculation which estimates the average duration of life in India at thirty years and eight months, which is equivalent to an annual death-rate of 32·57 per thousand. During 1877, the year of famine, the ascertained death-rate in Madras rose to 53·2, while the ascertained birth-rate fell to 16·3 per thousand. Both these rates are, of course, mere approximations to the truth, but they serve to indicate how famine attacks a people from two sides. In 1877 the death-rate among European troops in India was 12·71 per thousand, being the lowest ever recorded; among native troops, 13·38 per thousand; and in the public jails, 61·95 per thousand, rising to 176·01 per thousand in the jails of Madras.

AGRICULTURE.

The cultivation of the soil is the occupation of the Indian people, in a sense which is difficult to realize in England, and which cannot be adequately expressed by figures. As the land tax forms the mainstay of the imperial revenue, so the *ráyat* or cultivator constitutes the unit of the social system. The organized village community contains many other members besides the cultivators, but they all exist for his benefit, and all alike are directly maintained from the produce of the village fields. Even in considerable towns, the traders and handicraftsmen almost always possess plots of land of their own, on which they raise sufficient grain to supply their families with food. The operations of rural life are familiar to every class. They are enveloped in a cloud of religious sanctions, and serve to mark out by their recurring periods the annual round of common life. According to the returns of the general census of 1872, the number of adult males engaged in agriculture amounts to nearly 35 millions, or 56·2 per cent. of the total. To these ought to be added almost all the labourers, an additional 7½ millions, or 12·3 per cent.,—thus raising the grand total of persons directly supported by the land to more than two-thirds of the entire number of adult males, besides those indirectly or incidentally connected with it.

But though agriculture thus forms the staple industry of the country, its practice is pursued in different provinces with infinite variety of detail. Everywhere the same perpetual assiduity is found, but the inherited experience of generations has taught the cultivators to adapt their simple methods to differing circumstances. For irrigation, native patience and ingenuity have devised means which compare favourably with the colossal projects of Government. Manure is copiously applied to the more valuable crops whenever manure is available, its use being limited by poverty and not by ignorance. The rotation of crops is not adopted as a principle of cultivation; but in practice it is well known that a succession of exhausting crops cannot be taken in consecutive seasons from the same field, and the advantage of fallows is widely recognized. The periodicity of the seasons usually allows two, and sometimes three, harvests in the year, but not necessarily, nor indeed usually, on the same fields. For inexhaustible fertility, and for retentiveness of moisture in a dry year, no soil in the world can surpass the *regar* or "black cotton-soil" of the Deccan. In the broad river basins, the inundations deposit annually a fresh top-dressing of silt, thus superseding the necessity of manures.

The name of rice has from time immemorial been so closely associated with Indian agriculture, that it is difficult to realize how comparatively small an area is planted with this crop. If we except the deltas of the great rivers and the long strip of land fringing the western coast, rice may be called an occasional crop throughout the remainder of the peninsula. But where rice is grown, it is grown to the exclusion of all other crops. In British Burmah, out of a total cultivated area of 2,833,520 acres in 1877–78, as many as 2,554,853 acres, or 90 per cent., were under rice. Independent Burmah, on the other hand, grows no rice, but imports largely from British territory. For Bengal, unfortunately, no general statistics are available. But taking Rangpur as a typical district, it was there found that 1½ million acres, out of a classified total of a little over 1¾ million acres, or 88 per cent., were devoted to rice. Similar proportions hold good for the province of Orissa, the deltas of the Godávari, Kistna, and Káveri (Cauvery), and the lowlands of Travancore, Malabar, Kánara, and the Concan. For the North-Western Provinces and Oudh, again, no agricultural statistics are available; but though rice, grown in damp localities, or with the help of irrigation, forms a favourite food for the upper classes, the local supply requires to be supplemented by importation from Bengal. Throughout the remainder of the country, except in Assam, which is agriculturally a continuation of the Bengal delta, the cultivation of rice occupies but a subordinate place. The average out-turn per acre in Bengal has been estimated at 15 *maunds*, or 1200 lb, of cleaned rice. In the years 1877–78, when famine was raging in southern India, the total exports of rice from Calcutta amounted to more than 16 million cwts. In British Burmah there is but a single rice harvest in the year, corresponding to the *áman* of Bengal. The grain is reddish in colour and of a coarse quality; but the out-turn is much higher than in Bengal, reaching in some places an average of 2000 and 2500 lb per acre. The annual exports of rice from Burmah amount to about 12 million cwts. Besides being practically the sole crop grown in the deltaic swamps, rice is raised in patches in all the hill-valleys, from Coorg to the Himálayas. Rice.

Wheat is grown to some extent in almost every district; but, broadly speaking, it may be said that wheat does not thrive where rice does, nor, indeed, anywhere south of the Deccan. The great wheat-growing tract of India is the Punjab, where, in 1877–78, nearly 7 million acres, or 37 per cent. of the total cultivated area, were under this crop. For the North-Western Provinces and Oudh, in default of actual statistics, it has been estimated that the total area under wheat is as large as in the Punjab, though the relative proportion is less. Wheat is also grown in Behar and in the districts of Bengal that lie south of the Ganges. In the Central Provinces, in 1877–78, wheat was grown on 23 per cent. of the cultivated area, being the chief crop in the districts of Hoshangábád, Narsinhpur, and Ságar. In Bombay the corresponding proportion was less than 5 per cent., and in Sind 12 per cent. It has been conjectured that the total area under wheat in India is equal to the area under the same crop in the United States. Nor is the general out-turn contemptible, averaging about 13 bushels per acre in the Punjab, as compared with an average of 15½ bushels for the whole of France. The quality, also, of the grain is high enough to satisfy the demands of English millers; and "Calcutta Club No. 1" commands a price in Mark Lane not much below that of the Wheat.

finest Australian or Californian produce. Unfortunately, when a prosperous trade with Europe seemed on the point of establishing itself, the terrible year 1877–78 supervened, and India will now have to fight against the position of vantage occupied by the United States. According to the system of classification in Upper India, wheat ranks as a *rabí* or spring crop, being reaped at the close of the cold weather in April and May. Wherever possible, it is irrigated; and the extension of canals through the Gangetic Doáb has largely contributed to the substitution of wheat for inferior cereals.

Millet. Taking India as a whole, it may be affirmed that the staple food grain is neither rice nor wheat, but millet, which is probably the most prolific grain in the world, and the best adapted to the vicissitudes of a tropical climate. Excluding the special rice-growing tracts, varieties of millet are grown more extensively than any other crop from Madras, in the south, at least as far as Rájputána, in the north. The two most common kinds are great millet (*Holcus Sorghum* or *Sorghum vulgare*), known as *joár* or *jawárí* in the languages derived from the Sanskrit, as *jonna* in Telugu, and as *cholam* in Tamil; and spiked millet (*Holcus spicatus* vel *Penicillaria spicata*), called *bájra* in the north and *kambu* in the south. In Mysore and the neighbouring districts *rágí* (*Eleusine coracana*), called *náchani* in Bombay, takes the first place. According to the Madras system of classification, these millets all rank as "dry crops," being watered only by the local rainfall, and sown under either monsoon; farther north, they are classed with the *kharíf* or autumn harvest, as opposed to wheat. Indian corn is cultivated to a limited extent in all parts of the country; barley, in the upper valley of the Ganges, throughout the Punjab, and in Himálayan valleys; oats, only as an experimental crop by Europeans. *Joár* and *rágí*, but not *bájra*, are invaluable as fodder for cattle.

Oil-seeds. Oil-seeds also form an important crop in all parts of the country, being perhaps more universally grown than any other, as oil is necessary, according to native customs, for application to the person, for food, and for burning in lamps. In recent years the cultivation of oil-seeds has received an extraordinary stimulus owing to the demand for export to Europe, especially to France; but as they can be grown after rice, &c., as a second crop, this increase has hardly at all tended to diminish the production of food grains. The four chief varieties grown are mustard or rape seed, linseed, *tíl* or gingelly (sesamum), and castor-oil. Bengal and the North-Western Provinces are at present the chief sources of supply for the foreign demand, but gingelly is largely exported from Madras, and, to a smaller extent, from Burmah.

Vegetables. Vegetables are everywhere cultivated in garden plots for household use, and also on a larger scale in the neighbourhood of great towns. Among favourite native vegetables, the following may be mentioned:—the egg-plant, called *brinjal* or *baigan* (*Solanum Melongena*), potatoes, cabbages, cauliflower, radishes, onions, garlic, turnips, yams, and a great variety of cucurbitaceous plants, including *Cucumis sativus*, *Cucurbita maxima*, *Lagenaria vulgaris*, *Trichosanthes dioica*, and *Benincasa cerifera*. Of these, potatoes, cabbages, and turnips are of recent introduction. Almost all English vegetables can be raised by a careful gardener. Potatoes thrive best on the higher elevations, such as the Khásí hills, the Nílgiris, the Mysore uplands, and the slopes of the Himálayas; but they are also grown even in lowland districts. They were first introduced into the Khásí hills in 1830, and they now constitute the principal crop, the annual export to the Calcutta market being more than 7000 tons, valued at £50,000.

Fruits. Among cultivated fruits are the following:—Mango (*Mangifera indica*), plantain (*Musa paradisiaca*), pine-apple (*Ananassa sativa*), pomegranate (*Punica Granatum*), guava (*Psidium pomiferum* et *P. pyriferum*), tamarind (*Tamarindus indica*), jack (*Artocarpus integrifolia*), custard-apple (*Anona squamosa*), papaw (*Carica Papaya*), shaddock (*Citrus decumana*), and several varieties of fig, melon, orange, lime, and citron. According to the universal verdict of Europeans, no native fruits can compare with those of England. But the mangoes of Bombay, of Múltán, and of Maldah in Bengal, and the oranges of the Khásí hills, enjoy a high reputation; while the guavas of Madras are made into an excellent preserve.

Spices. Among spices, for the preparation of curry and other hot dishes, turmeric and chillies hold the first place, being very generally cultivated. Next in importance come ginger, coriander, aniseed, black cummin, and fenugreek. Pepper proper is confined to the Malabar coast, from Kánara to Travancore. Cardamoms are a valuable crop in the same locality, and also in the Nepálese Himálayas. *Pán* or betel-leaf is grown by a special caste in most parts of the country. Its cultivation requires constant care, but is highly remunerative. Betel-nut or areca is chiefly grown in certain favoured localities, such as the deltaic districts of Bengal and the highlands of southern India.

Palms. Besides betel-nut (*Areca Catechu*), the palms of India include the cocoa-nut (*Cocos nucifera*), the bastard date (*Phœnix sylvestris*), the palmyra (*Borassus flabelliformis*), and the true date (*Phœnix dactylifera*). The cocoa-nut, which loves a sandy soil and a moist climate, is found in greatest perfection along the strip of coast-line that fringes the west of the peninsula, where it ranks next to rice as the staple product. The bastard date, grown chiefly in the country round Calcutta and in the north-east of the Madras presidency, supplies both the jaggery sugar of commerce and intoxicating liquors for local consumption. Spirit is also distilled from the palmyra, especially in the neighbourhood of Bombay and in the south-east of Madras. The true date is almost confined to Sind.

Sugar. Sugar is manufactured both from the sugar-cane and from the bastard date-palm, but the total production is inadequate to the local demand. The best cane is grown in the North-Western Provinces, on irrigated land. It is an expensive crop, requiring much attention, and not yielding a return within the year; but the profits are proportionately large. In Bengal the manufacture of sugar for exportation has declined during the century; but in Jessor district the preparation of date-sugar is a thriving and popular industry. The manufacture of sugar is everywhere in the hands of natives, except in the case of the Aska factory in the Madras district of Ganjám, and the Ashtagrám factory in Mysore. Both these factories, which use sugar-cane and not date, have received honourable notice at exhibitions in Europe.

Cotton. Cotton holds the first place among agricultural products grown for export. From the earliest times, cotton has been grown in sufficient quantities to meet the local demand, and even in the last century there was some slight export which was carefully fostered by the East India Company. But the present importance of the crop dates only from the crisis in Lancashire caused by the American War. Prior to 1860 the exports of raw cotton from India used to average less than 3 millions sterling a year; but after that date they rose by leaps, until in 1866 they reached the enormous total of 37 millions. Then came the crash, caused by the restoration of peace in the United States, and the exports fell, until they now average little more than 8 millions a year. The fact is that Indian cotton has a short staple, and cannot compete with the best American cotton for spinning the finer qualities of yarn. But while the cotton famine was at its height, the cultivators were intelligent enough to make the most of their opportunity. The area under cotton increased enormously, and the growers managed to retain in their own hands a fair share of the profit.

Cotton-growing tracts. The principal cotton-growing tracts are the plains of Guzerat and Káthiáwár, whence Indian cotton has received in the Liverpool market the historic name of Surat; the highlands of the Deccan; and the deep valleys of the Central Provinces and Berar. The best native varieties are found in the Central Provinces and Berar, passing under the trade names of Hinganghát and Amráoti. These varieties have been successfully introduced into the Bombay district of Khándesh. Experiments with seed from New Orleans have been conducted for several years past on the Government farms in many parts of India; but it cannot be said that they have resulted in success except in the Bombay district of Dhárwár, where exotic cotton has now generally supplanted the indigenous staple. In 1875–76 the total area under cotton in the Bombay presidency, including Sind and the native states, amounted to 4,516,587 acres, with a yield of 2,142,835 cwts. Of this total, 583,854 acres, or 13 per cent., were sown with exotic cotton, including that from the Central Provinces and also that from New Orleans, with a yield of 248,767 cwts. The average yield was about 53 lb of cleaned cotton per acre, the highest being in Sind and Guzerat, and the lowest in the southern Marhattá country. In the same year the total exports were 3,887,808 cwts., valued at £10,673,761. In 1877–78 the area under cotton in the Central Provinces was 837,083 acres, or 5 per cent. of the total cultivated area, chiefly in the districts of Wárdhá, Nágpur, and Ráipur. The average yield was about 59 lb per acre. The total exports to Bombay, including re-exports from Berar, were about 300,000 cwts., chiefly in compressed bales, valued at £672,000. In the same year the area under cotton in Berar was 2,078,273 acres, or 32 per cent. of the total cultivated area, chiefly in the two districts of Akola and Amráoti. The average yield was as high as 67 lb of cleaned cotton per acre. The total export was valued at £2,354,946, almost entirely railway-borne. In Madras the average area under cotton is about 1,500,000 acres, chiefly in the upland districts of Bellary and Karnúl, and the low plains of Kistna and Tinnevelli. The total exports in 1875–76 were 733,420 cwts., valued at £1,652,849. In Bengal the cultivation of cotton is on the decline. The local demand is satisfied by imports from the North-Western Provinces and from the bordering hill tracts, where a very short-stapled variety of cotton is extensively cultivated. The total area under cotton in Bengal is estimated at only 162,000 acres, yielding 138,000 cwts. of cleaned cotton. Of this, 31,000 acres were in Sáran, 28,000 in the Chittagong hill tracts, and 20,000 in Cuttack. Throughout the North-Western Provinces, and also the Punjab, sufficient cotton is grown to meet the wants of the village weavers. The total exports of raw cotton from Indian ports in 1878–79 were 2,966,569 cwts., valued at £7,914,091, besides cotton twist and yarn to the value of £937,698, and cotton manufactures valued at £1,644,125.

Jute. Jute ranks next after cotton as a fibre crop. The extension of its cultivation has been equally rapid, and it is yet more limited in its area, being confined to northern and eastern Bengal. In this tract, which extends from Purniah to Goálpárá, north of the Ganges for the most part, and along both banks of the Brahmaputra, jute is grown on almost every variety of soil. The chief characteristic of the cultivation is that it remains entirely under the control of the cultivator. Practically a peasant proprietor, he increases or diminishes his cultivation according to the state of the market, and keeps the profits in his own hands. The demand for jute in Europe has contributed more than any administrative reform to raise the average standard of comfort throughout eastern Bengal. In 1872, when speculation was briskest, it is estimated that about 1 million acres were under jute, distributed over sixteen districts, which had a total cultivable area of 23 million acres. The total export from Calcutta in that year was about 7 million cwts., valued at £4,142,548. Both quantities and prices have since somewhat declined, but the business remains on a stable footing. In 1878–79 the total export of raw jute from India was 6,021,382 cwts., valued at £3,800,426, besides jute manufactures to the value of £1,098,434.

Indigo. Indigo, though relatively of less importance than formerly, is still the foremost staple grown by European capital. In Bengal Proper its cultivation has greatly declined since the early years of this century. English planters have abandoned the districts of Húglí (Hooghly), the Twenty-four Parganás, Dacca, Farídpur, Rangpur, and Pabná, which are dotted with the sites of ruined factories. In Nadiyá, Jessor, Murshidábád, and Maldah, the industry is still carried on, but it has not recovered from the depression caused by the indigo riots of 1860, and the emancipation of the peasantry by the Land Act of 1859. Dye of superior quality is manufactured in Midnapur, along the frontier of the hill tracts. But indigo cultivation on the old scale still flourishes in North Behar, from which is derived one-half of the total exports from Calcutta. No accurate statistics of area are available; but in Tirhut alone there are fifty-six principal concerns, with seventy outworks, producing annually about 20,000 *maunds* of dye; in Sáran, thirty principal concerns and twenty-five outworks, producing about 12,000 *maunds*; in Champáran, seven large concerns, producing also 12,000 *maunds*.[1] It has been estimated that the total amount of money annually distributed by the planters of North Behar cannot be less than 1 million sterling. Across the border, in the North-Western Provinces, indigo is grown and manufactured to a considerable extent by native cultivators. In the Punjab, also, indigo is an important crop, especially in the districts of Múltán, Muzaffargarh, and Derá Ghází Khán. In Madras, where it is grown and manufactured entirely by the natives, the total area under indigo is about 300,000 acres, chiefly in the north-east of the presidency, extending along the coast from Kistna to South Arcot, and inland to Karnúl and Cuddapah. The exports of indigo from all India in 1878–79 amounted to 105,051 cwts., of the value of £2,960,463.

Opium. The opium of commerce is grown and manufactured in two special tracts,—(1) the valley of the Ganges round Patná and Benares, and (2) a fertile table-land in Central India, corresponding to the old kingdom of Máwá, for the most part still under the rule of native chiefs, among whom Sindhia and Holkar rank first. In the latter of these two regions the cultivation of poppy is free, and the duty is levied as the opium passes through the British presidency of Bombay; in the former, the cultivation is a strict Government monopoly. Opium is also grown for local consumption throughout Rájputána, and to a very limited extent in the Punjab and the Central Provinces. Throughout the rest of India it is absolutely prohibited. In the Ganges valley, the cultivation is supervised from two agencies, with their headquarters at Patná and Gházípur, at which two towns alone the manufacture is conducted. In 1872 the total area under poppy was 560,000 acres; the number of chests of opium sold was 42,675; and the sum realized was £6,067,701, giving a net revenue of £4,259,376. The whole of this was exported from Calcutta to China and the Straits Settlements. The amount of opium grown in native states and exported from Bombay is about equal, thus raising the average exports of opium to about 12 millions sterling, of which about 7½ millions represent net profit to Government. In 1878–79, 91,200 chests of opium were exported, of the value of £12,993,985, of which £7,700,000 represented the net profit to Government.

Bengal system. Under the Bengal system annual engagements are entered into by the cultivators to sow a certain quantity of land with poppy; and it is a fundamental principle that they may agree or refuse to engage as they please. As with most other Indian industries, a pecuniary advance is made to the cultivator before he commences operations, which is balanced when he delivers over the opium at the subordinate agencies. He is compelled to deliver his whole produce, being paid at a fixed rate according to quality. In the beginning of April the cultivators bring in their opium to the subordinate Government agencies, where it is examined and weighed, and the accounts are settled. The final process of preparing the drug in balls for the Chinese market is conducted at the two central Government agencies at Patná and Ghazípur. This generally lasts until the end of July, but the balls are not dry enough to be packed in chests until October.

[1] The factory *maund* of indigo weighs 74 lb 10 oz.

Tobacco. Tobacco is grown in every district of India for local consumption. The soil and climate are favourable; but up to the present time the quality of native-cured tobacco is so inferior that it finds no market in Europe. The principal tobacco-growing tracts are Rangpur and Tirhut in Bengal, Kaira in Bombay, and the delta of the Godávari and Coimbatore and Madura districts in Madras. The two last-mentioned districts supply the raw material for the well-known "Trichinopoli cheroot," almost the only form of Indian tobacco that finds any favour with Europeans; the produce of the *lánkás* or alluvial islands in the Godávari is manufactured into "coconadas." The tobacco of northern Bengal is largely exported to British Burmah, for the Burmese, who are great smokers, do not grow sufficient for their own needs. In the year 1876–77 the total registered imports of tobacco into Calcutta were 400,000 cwt., valued at £261,000, of which more than half came from the single district of Rangpur. Tobacco is also grown for export in the hill tracts of Chittagong. The tobacco of Tirhut is chiefly exported towards the west. The total area under tobacco in that district is estimated at 40,000 acres, the best quality being grown in *parganá* Saressa of the Tájpur subdivision.

Since 1875 a private firm of capitalists, backed by Government support, has begun to grow tobacco and manufacture it for the European market. The scene of operations is two abandoned stud-farms at Gházípur in the North-Western Provinces, and at Pusa in the Bengal district of Tirhut. In the year 1878–79 about 240 acres in all were cultivated with tobacco, and the total crop was about 160,000 lb. No less than five English or American curers were employed. Some of the produce was exported to England as "cured leaf"; but the larger part was put upon the Indian market in the form of "manufactured smoking mixture." This mixture is in demand at regimental messes and canteens, and has already found its way to Australia. The enterprise may now be said to have passed beyond the stage of experiment, and has probably opened a new sphere alike for Indian agriculture and European capital. The one essential condition of success is skilled supervision in the delicate processes of tobacco-curing. Tobacco to the value of £128,239 was exported from India in 1878–79.

Coffee. The cultivation of coffee is confined to southern India, though attempts have been made to introduce the plant both into British Burmah and into the Bengal district of Chittagong. The coffee tract may be roughly defined as a section of the landward slope of the Western Gháts, extending from Kánara in the north to Travancore in the extreme south. That tract includes almost the whole of Coorg, the districts of Kádur and Hassan in Mysore, and the Nílgiri hills, enlarged by the recent annexation of the Wainád. Within the last few years the cultivation has extended to the Shevaroy hills in Salem district, and to the Palni hills in Madura.

Unlike tea, coffee was not introduced into India by European enterprise; and even to the present day its cultivation is largely followed by the natives. The Malabar coast has always enjoyed a direct commerce with Arabia, and at an early date gave many converts to Islám. One of these converts, Bába Budan by name, is said to have gone on a pilgrimage to Mecca and to have brought back with him the coffee berry, which he planted on the hill range in Mysore still called after him. According to local tradition this happened about two centuries ago. The shrubs thus sown lived on, but the cultivation did not spread until the beginning of the present century. The state of Mysore and the Bába Budan range also witnessed the first opening of a coffee-garden by an English planter about 1840. The success of this experiment led to the extension of coffee cultivation into the neighbouring tract of Manjarábád, also in Mysore, and into the Wainád subdivision of the Madras district of Malabar. From 1840 to 1860 the enterprise made slow progress; but since the latter date it has spread with great rapidity along the whole line of the Western Gháts, clearing away the primæval forest, and opening a new era of prosperity to the labouring classes. The following statistics show the area under coffee for the year 1877–78:—in Mysore, 128,438 acres, almost confined to the two districts of Hassan and Kádur; in Madras, 58,988 acres, chiefly in Malabar, the Nílgiris, and Salem; in Coorg, 45,150 acres; total, 232,576 acres, exclusive of Travancore. The average rate of produce is estimated at about 3 cwts. per acre of mature plant. The total export of coffee in 1878–79 was 342,268 cwts., valued at £1,548,481.

Tea. The cultivation of tea in India commenced within the memory of men still living in 1881, and the industry now rivals indigo as a field for European capital. Unlike coffee-planting the enterprise owes its origin to the initiation of Government, and has never attracted the attention of the natives. Early travellers reported that the tea-plant was indigenous to the southern valleys of the Himálayas; but they were mistaken in the identity of the shrub, which was the *Osyris nepalensis*. The real tea (*Thea viridis*), a plant akin to the camellia, grows wild in Assam, being commonly found throughout the hilly tract between the valleys of the Brahmaputra and the Bárak. There it sometimes attains the dimensions of a large tree; and from that, as well as from other indications, it has been plausibly inferred that Assam is the original home of the plant, which was thence introduced at a prehistoric date into China. The real progress of tea-planting in Assam dates from about 1851, and was greatly assisted by the promulgation of the Waste-land Rules of 1854. By 1859 there were already fifty-one gardens in existence, owned by private individuals; and the enterprise had extended from its original headquarters in Lakhimpur and Síbságar as far down the Brahmaputra as Kámrúp. In 1856 the tea-plant was discovered wild in the district of Cáchár in the Bárak valley, and European capital was at once directed to that quarter. At about the same time tea-planting was introduced into the neighbourhood of the sanatorium of Dárjíling (Darjeeling), among the Sikkim Himálayas. The success of these undertakings engendered a wild spirit of speculation in tea companies both in India and at home, which reached its climax in 1865. The industry recovered but slowly from the effects of this disastrous crisis, and did not again reach a stable position until 1869. Since that date it has rapidly but steadily progressed, and has been ever opening new fields of enterprise. At the head of the Bay of Bengal in Chittagong district, side by side with coffee on the Nílgiri hills, on the forest-clad slopes of Chutiá Nágpur, amid the low-lying jungle of the Bhután Dwars, and even in Arakan, the energetic pioneers of tea-planting have established their industry. Different degrees of success may have rewarded them, but in no case have they abandoned the struggle. The market for Indian tea is practically inexhaustible. There is no reason to suppose that all the suitable localities for its growth have yet been tried; and we may look forward to the day when India shall not only rival but supersede China in her staple product. (Tea-growing tracts.)

The following statistics, unless it is otherwise stated, refer to the year 1877–78:—

The total area taken up for tea cultivation in Assam, including both the Brahmaputra and the Bárak valleys, was 736,082 acres, of which 538,961 acres were fit for cultivation; the total number of separate estates was 1718; the total out-turn was 23,352,298 lb, at the average rate of 286 lb per acre under mature plant. In Bengal, the area taken up was 62,642 acres, of which 20,462 acres were under mature plant, including 18,120 acres in the single district of Dárjíling; the number of gardens was 221; the out-turn was 5,768,654 lb, at the rate of 282 lb per acre under mature plant. In the North-Western Provinces, there were, in 1876, 25 estates in the districts of Kumáun and Garhwál, with an out-turn of 578,000 lb, of which 350,000 lb were sold in India to Central Asia merchants; and in 1871, 19 estates in Dehra Dún, with 2024 acres under tea, and an out-turn of 297,828 lb. In the Punjab, there were 10,046 acres under tea, almost entirely confined to Kángrá district, with an out-turn of 1,113,106 lb, or 111 lb per acre. In Madras, the area under tea on the Nílgiris was 3160 acres; the exports from the presidency were 183,178 lb, valued at £19,308. Excluding the figures just given for Madras, the whole of the Indian tea is shipped from the port of Calcutta, and almost the whole is sent to the United Kingdom. The total exports for 1878–79 were 34,800,027 lb, valued at £3,170,118. Of the total supply, about 26,000,000 lb came from Assam, about 8,000,000 lb from Bengal, 787,000 lb from the North-Western Provinces, and 684,000 lb from the Punjab. In the previous year the exports of tea from the Punjab to Central Asia were returned at 1,217,840 lb, valued at £181,634, being a considerable decrease on the year before. (Area and out-turn of tea.)

Approximate Area in Acres occupied by the Principal Crops in some Indian Provinces in 1877-1878.

The introduction of the quinine-yielding cinchona into India is a remarkable example of success rewarding the indefatigable exertions of a single man. When Mr Clements Markham undertook the task of transporting the seedlings from South America in 1860, cinchona had never before been reared artificially. But the novel experiment in arboriculture has not only been successfully conducted, but has proved remunerative from a pecuniary point of view. A cheap febrifuge has been provided, in the form of the mixed cinchona alkaloids, for the fever-stricken population of the Indian plains, while the surplus bark sold in Europe more than repays interest upon the capital expended. These results have been produced from an expenditure of about £100,000. The headquarters of cinchona cultivation are on the Nílgiri hills, where Government owns several plantations covering an aggregate of about 1000 acres, with about 570,000 full-grown plants. From the Government plantations cinchona seeds and plants are annually distributed to the public in large quantities; and there are now several private plantations rivalling the Government estates in area, and understood to be very valuable properties. The varieties of cinchona most commonly cultivated are *C. officinalis* and *C. succirubra*; but experiments are being conducted with *C. Calisaya*, *C. pubescens*, *C. lanceolata*, and *C. pitayensis*. When the success of the enterprise was secure, Government somewhat curtailed the extent of its own operations. No fresh land was taken up, but the plantations were kept free from weeds. The quinologist's department was abolished, and the bark sold in its raw state. From the central establishment on the Nílgiris cinchona has been introduced into the Palni hills in Madura district, into the Wainád, and into the state of Travancore. Plantations have also been successfully opened by Government near Merkara in Coorg, on the Bába Budan hills in Mysore, and in Sitang district in British Burmah. Failure has attended the experiments made at Mahábaleshwar in the Bombay presidency, and at Nongklao in the Khásí hills, Assam. But the success of the Government plantation at Dárjíling, in northern Bengal, rivals that of the original plantation on the Nílgiris. The area has been gradually extended to more than 2000 acres, and the bark is manufactured into quinine on the spot by a Government quinologist. The species mostly grown is *C. succirubra*, which supplies a red-coloured bark, rich in its total yield of alkaloids but comparatively poor in quinine proper. Efforts are being made to increase the cultivation of *C. Calisaya*, which yields the more valuable bark, but is difficult to propagate.

The following are the financial results of the two Government plantations in 1877–78. On the Nílgiris the crop was 138,808 ℔, of which 132,951 ℔ were shipped to England, and the rest supplied to the Madras and Bombay medical departments. The total receipts were £35,875, and the total expenditure £6977, thus showing a net profit of £28,898. At Dárjíling the crop amounted to 344,225 ℔ of bark, which was all handed over to the quinologist, and yielded 5162 ℔ of the febrifuge. The total receipts were £9707, of which £6188 represents the amount debited to Government departments for the sale of febrifuge and bark, while £3519 was derived from sales to the public. The total expenditure was £8554, of which £5790 was expended upon the plantation, and £2764 on the quinologist's department. The net profit, therefore, was £1153, which is expected shortly to rise to £4000 a year, as more of the young plants come into bearing.

Silk.—Sericulture in India is a stationary, if not a declining, industry. The large production in China, Japan, and Silk. the Mediterranean countries controls the European markets, and on an average of years the imports of raw silk into India now exceed the exports. The East India Company from the first took great pains to foster the production of silk. As early as 1767, two years after the grant of the financial administration of Bengal had been conferred upon the Company, we find the governor, Mr Verelst, personally urging the *zamíndárs*, gathered at Murshidábád for the ceremony of the *púnyá*, "to give all possible encouragement to the cultivation of mulberry." In 1769 a colony of reelers was brought from Italy to teach the system followed in the filatures at Novi. The first silk prepared in the Italian method reached England in 1772, and Bengal silk soon became an important article of export. Similar efforts started at Madras in 1793 were abandoned after a trial of five years. Sericulture is said to have been introduced into Mysore by Tipú Sultán, and for many years continued to prosper. But recently the worms have been afflicted by a mysterious epidemic; and despite the enterprise of an Italian gentleman who imported fresh broods from Japan, the business has dwindled to insignificance. Bengal has always been the chief seat of mulberry cultivation. When the trading operations of the Company ceased in 1833, they owned eleven head factories in that province, each supplied by numerous filatures to which the cultivators brought in their cocoons. The annual export of raw silk from Calcutta was then about 1 million ℔. But in those days the weaving of silk formed a large portion of the business of the factories. In 1779 Rennel wrote that at Kasímbázár (Cossimbazar) alone about 400,000 ℔ were consumed in the several European factories. In 1802 Lord Valentia describes Jangipur as "the greatest silk station of the Company, with 600 furnaces, and giving employment to 3000 persons."

When the Company abandoned trade on its own account, sericulture was forthwith taken up by private enterprise, and it still clings to its old headquarters. At the present time the cultivation of the mulberry is mainly confined to the Rájsháhí and Bardwán divisions of Lower Bengal. That branch of agriculture, together with the rearing of the silk-worms, is conducted by the peasantry themselves, who are free to follow or abandon the business. The destination of the cocoons is twofold. They may either be sent to small native filatures, where the silk is roughly wound before being consumed in the hand-looms of the country; or they may be brought to the great European factories, which generally use steam machinery and consign their produce direct to Europe.

The cultivation of the mulberry is chiefly carried on in the districts of Rájsháhí, Bográ, Maldah, Murshidábád, Bírbhúm, Bardwán, and Midnapur. No accurate statistics are available, but in Rájsháhí alone the area under mulberry is estimated at 80,000 acres. The variety grown as food for the silk-worms is not the fruit-tree that is common in England, but a comparatively small shrub.

Silk-worms.

Besides the silk-worm proper (*Bombyx mori*), fed upon the mulberry, several other species of silk-yielding worms abound in the jungles of India, and are utilized, and in some cases domesticated, by the natives. Throughout Assam especially, an inferior silk, produced in this way, has from time immemorial furnished the common dress of the people. These "wild silks" are known to commerce under the generic name of *tasar* or *tusser*, but they are really the produce of several distinct varieties of worm, fed on many different trees. The worm that yields *tasar* silk in Chutiá Nágpur has been identified as the caterpillar of *Antheræa paphia*. When wild, it feeds indiscriminately upon the *sál* (*Shorea robusta*), *baer* (*Zizyphus Jujuba*), and other forest trees; but in a state of semi-domestication it is exclusively reared upon the *ásan* (*Terminalia alata*), which grows conveniently in clumps. The cocoons are sometimes collected in the jungle, but more frequently bred from an earlier generation of jungle cocoons. The worms require constant attention while feeding to protect them from crows and other birds. They give three crops in the year—in August, November, and May—of which the second is by far the most important. The *tasar* silk-worm is also found and utilized throughout the Central Provinces, in the hills of the Bombay presidency, and along the southern slope of the Himálayas. During the past twenty years repeated attempts have been made to raise this industry out of its precarious condition, and to introduce *tasar* silk into the European market. That the raw material abounds is certain, but the great difficulty is to obtain it in a state that will be acceptable to European manufacturers. Native spun silk is only fit for native hand-looms. In Assam two distinct qualities of silk are made, known as *eriá* and *mugá*. The former is obtained from the cocoons of *Phalæna cynthia*, and the worm is fed, as the native name implies, upon the leaves of the castor-oil plant (*Ricinus communis*). This variety may be said to be entirely domesticated, being reared indoors. *Mugá* silk is obtained from the cocoons of *Saturnia assamungis*. The moth, which is remarkable for its size, is found wild in the jungle, but the breed is so far domesticated that cocoons are brought from one part of the province to another, and the *súm* tree is artificially propagated to supply the worms with food. Raw silk was exported in 1878–79 to the extent of 1,534,715 lb, valued at £623,871, besides manufactured silk of the value of £195,897.

Lac.

The collection of lac is in a somewhat similar position to that of *tasar* silk. The lac insect abounds on certain jungle trees in every part of the country, and from time immemorial it has been collected by the wild tribes in order to be worked up into lacquered ware. European enterprise has tried, with small success, to place the industry upon a stable and remunerative basis. Though lac is to be found everywhere, the foreign exports are almost entirely confined to Calcutta, which draws its supplies from the hills of Chutiá Nágpur, and to a less degree from Assam and Mírzápur in the North-Western Provinces. Lac is known to commerce both as a gum (shellac) and as a dye. The total exports in 1879 were 91,983 cwts., valued at £300,072.

Farming.

Farming.—The efforts of Government to improve the native methods of agriculture, by the establishment of model farms under skilled European supervision, have not been generally successful.[1]

Cattle.

Stock.—Throughout the whole of India, except in Sind and the western districts of the Punjab, horned cattle are the only beasts used for ploughing. The well-known humped breed of cattle predominates everywhere, being divided into many varieties. Owing partly to unfavourable conditions of climate and soil, partly to the insufficiency of grazing ground, and partly to the want of selection in breeding, the general condition of the cattle is miserably poor. As cultivation advances, the area of waste land available for grazing steadily diminishes, and the prospects of the poor beasts are becoming worse rather than better. Their only hope lies in the introduction of fodder crops as a regular stage in the agricultural course. There are, however, some fine breeds in existence. In Mysore the *amrit mahál*, a breed said to have been introduced by Hyder Alí for military purposes, is still kept up by Government. In the Madras districts of Nellore and Karnúl the indigenous breed has been greatly improved under the stimulus of cattle shows and prizes, founded by British officials. In the Central Provinces there is a peculiar breed of trotting bullocks which is in great demand for wheeled carriages. The large and handsome oxen of Guzerat in Bombay and of Hariáná in the Punjab are excellently adapted for drawing heavy loads in a sandy soil. The worst cattle are to be found always in the deltaic tracts, but there their place is to a large extent taken by buffaloes. These last are Buf more hardy than ordinary cattle; their character is maintained by crossing the cows with wild bulls, and their milk yields the best *ghí*, or clarified butter. In British Burmah, the returns show that the total number of buffaloes is just equal to that of cows and bullocks, being about 700,000. Along the valley of the Indus, and in the sandy desert Can which stretches into Rájputána, camels supersede cattle for agricultural operations. In the Punjab, the total estimated number of camels is 170,000. The breed of Hor horses has generally deteriorated since the demand for military purposes has declined with the establishment of British supremacy. In Bengal Proper, and also in Madras, it may be broadly said that horses are not bred. The chief breeds in Bombay are those of the Deccan and of Káthiáwár, in both of which provinces Government maintains establishments of stallions. The Punjab, however, is the chief source of remounts for the cavalry regiments, the total number of horses in that province being returned at 80,000, in addition to 50,000 ponies. About the beginning of the present century, a stud department was organized to breed horses for the use of the Bengal army, but this system was abolished as extravagant and inefficient under the governor-generalship of Lord Mayo. Remounts are now obtained in the open market; but the Government of the Punjab still maintains about 130 stallions, including 60 imported from England and 40 Arabs. The best horses are bred by the Baluchí tribes along the western frontier. The best ponies come from Burmah, Manipur (the original home of the now well-known game of polo), and Bhután. Four great horse fairs are held in the year—at Ráwal Pindí, Derá Ghází Khán, Jhang, and Derá Ismáil Khán—at which about 4500 horses were exhibited in 1877–78, and a total sum of about £1300 was awarded in prizes; the average price given for native cavalry remounts was only £17. In recent years much attention has been paid in the Punjab to the breeding of mules for military purposes; and the value of Mul these animals was conspicuously proved in the course of

[1] Model farms have been abandoned in Bengal, in Assam, and in the Punjab. In the North-Western Provinces valuable experiments are prosecuted. In Bombay there are three model farms, and in the Central Provinces one, on which the common crops of the country are raised at a loss. The Saidapet farm, near the city of Madras, is the only establishment at which important experiments have been conducted on a scale and with a perseverance sufficient to yield results of value. This farm was started by the governor, Sir William Denison, in 1865, and has been for the past nine years under the management of Mr Robertson. It now (1881) covers an area of 250 acres in a ring fence. Many important experiments have been made, of which some have produced encouraging results, indicating the general direction in which improvements may be effected in the agricultural practice of the presidency. It has been proved that many of the common "dry crops" can be profitably cultivated for fodder at all seasons of the year. Those most strongly recommended are yellow cholam (*Sorghum vulgare*), guinea grass (*Panicum jumentaceum*), and horse-gram (*Dolichus uniflorus*). Sugar-cane and rice also yield excellent fodder when cut green. Attention has also been given to subsoil drainage, deep ploughing, the fertilizing powers of various manures, and the proper utilization of irrigation water. It has been decided to establish a school of agriculture at Saidapet in connexion with the model farm, with subordinate branches in the districts, so as to diffuse as widely as possible the agricultural lessons that have been already learned. In the year 1877–78 the total expenditure at Saidapet on both farm and school of agriculture was about £6000.

the operations in Afghánistán in 1879–80. Government maintains about fifty donkey stallions, of which four were imported from Spain, twenty-eight from Arabia, and twelve from Bokhara. Some of the mules bred reach the height of 15 hands. The catching of elephants is now a Government monopoly or under Government supervision, except in Malabar and Travancore where the old proprietors retain the right. The chief source of supply is the north-east frontier, especially the range of hills running between the valleys of the Brahmaputra and the Bárak (see *ante*, p. 742). Sheep and goats are commonly reared in the wilder parts of the country for the sake of their wool. Both their weight for the butcher and their yield of wool are exceedingly low. In Mysore, and with considerable success at the Saidapet farm, attempts have been made to improve the breed of sheep by crossing with merino rams. Pigs of great size and most repulsive appearance are reared, and eaten by the lowest of out-castes.

Sheep and goats.

Approximate Numbers of Agricultural Stock and Implements in some Indian Provinces in 1877–1878.

	Madras	Bombay and Sind.	Punjab.	Central Provinces.	British Burmah.	Mysore.	Berar.

The forests of India, both as a source of natural wealth and as a department of the administration, are beginning to receive their proper share of attention. Up to a recent date the destruction of forests by timber cutters, by charcoal burners, and above all by nomadic cultivation, was allowed to go on everywhere unchecked. The extension of cultivation was considered as the chief care of Government, and no regard was paid to the improvident waste going on on all sides. But as the pressure of population on the soil became more dense, and the construction of railways increased the demand for fuel, the question of forest conservation forced itself into notice. It was recognized that the inheritance of future generations was being recklessly sacrificed to satisfy the immoderate desire for profit. And at the same time the importance of forests as affecting the general meteorology of a country was being learned from bitter experience in Europe. On many grounds, therefore, it became necessary to preserve what remained of the forests in India, and to repair the mischief of previous neglect even at considerable expense. In 1844 and 1847 the subject was actively taken up by the Governments of Bombay and Madras. In 1864 Dr Brandis was appointed inspector-general of forests to the Government of India, and in the following year an act of the legislature was passed (No. VII. of 1865). The regular training of candidates for the Forest Department in the schools of France and Germany dates from 1867. In the short interval that has since elapsed, sound principles of forest administration have been gradually extended. Indiscriminate timber-cutting has been prohibited, the burning of the jungle by the hill tribes has been confined within bounds, large areas have been surveyed and demarcated, plantations have been laid out, and, generally, forest conservation has become a reality.

From the point of view of administration, the forests are classified as "reserved" or "open." The reserved forests are those under the immediate control of officers of the Forest Department; they are managed as the property of the state, with a single eye to conservancy and their future development as a source of national wealth. Their limits are demarcated after survey, nomadic cultivation by the hill tribes is prohibited, cattle are excluded from grazing, destructive creepers are cut down, and the hewing of timber, if permitted at all, is placed under stringent regulations. The open forests are less carefully guarded; but in them also certain kinds of timber-trees are preserved. A third class of forest lands consists of plantations, on which large sums of money are spent annually. It is impossible to present in a single view the entire result of the labours of the Forest Department. In 1872–73 the total area of reserved forests in India was estimated at more than 6,000,000 acres; and the area has probably been doubled since that date. In the same year the total forest revenue was £477,000, as compared with an expenditure of £295,000, thus showing a surplus of £182,000. By 1877–78 the revenue had increased to £664,102, of which £160,308 was derived from British Burmah, and £126,163 from Bombay. The forest exports in that year included—teak, valued at £406,652; lac and lac-dye, £362,008; caoutchouc, £89,381; and gums, £183,685. But no figures that can be given exhibit adequately the labour and the benefits of the Forest Department, which is gradually winning back for the country the fee-simple of her forest wealth, when it was on the point of being squandered beyond possibility of redemption.

Nomadic cultivation.

The practice of nomadic cultivation by the hill tribes may conveniently be described in connexion with forest conservation, of which it is the most formidable enemy. In all the great virgin forests of India, in Arakan, on the north-east frontier of Assam and Chittagong, throughout the Central Provinces, and along the line of the Western Gháts, the aboriginal tribes raise their crops of rice, cotton, &c., in this manner. A similar system has been found to prevail in Madagascar; and indeed, from its simplicity and its appropriateness it may fairly be called the most primitive mode of agriculture known to the human race. Known as *toungya* in Burmah, *júm* on the north-east frontier, *dahya* in Central India, *kil* in the Himálayas, and *kumárí* in the Western Gháts, it is practised, without any material differences, by tribes of the most diverse origin. Its essential features are the burning down of a patch of forest, and sowing the crop with little or no tillage on the clearing thus formed. The tribes of the western coast break up the cleared soil with a sort of hoe-pick and spade or even with the plough; in other parts the soil is merely scratched with a knife, or the seed is scattered on its surface without any cultivation at all. In some cases a crop is taken off the same clearing for two or even three years in succession, but more usually the tribe moves off every year to a fresh field of operations. To these nomad cultivators the words rhetorically used by Tacitus of the primitive Germans are strictly applicable—*Arva per annos mutant; et superest ager.* The wanton destruction thus wrought in the forests is simply incalculable. In addition to the timber-trees deliberately burned down to clear the soil, the fire thus started not unfrequently runs wild through the forest, and devastates many square miles. Wherever timber has any value from the proximity of a market, the first care of the Forest Department is to prohibit these fires, and to assign heavy penalties for any infringement of its rules. The success of a year's operations is mainly estimated by the degree in which the reserves have been saved from the flame.

But vast tracts of country yet remain in which it would be equally useless and impossible to place restraint upon nomad cultivation, which is admitted to yield a larger profit than ordinary cultivation with the plough. A virgin soil, manured many inches deep with ashes and watered by the full burst of a tropical rainfall, returns forty and fifty-fold of rice, which is the staple grain thus raised. In addition to rice, Indian corn, millet, oil-seeds, and cotton are sometimes grown in the same clearing, the seeds being all thrown into the ground together, and each crop ripening in succession at its own season. Except to the eyes of a forest officer, a patch of *júm* cultivation is a very picturesque sight. Men, women, and children all work together with a will, for the trees must be felled and burned, and the seed sown, before the monsoon breaks.

Irrigation. Irrigation is everywhere dependent upon the two supreme considerations of water supply and land level. The sandy desert that extends from the hills of Rájputána to the basin of the Indus is more absolutely closed to irrigation than the confused system of hill and valley in Central India. Farther west, in the Indus valley, irrigation becomes possible, and in no part of India has it been conducted with greater perseverance and success. The entire province of Sind, and hardly less the lower districts of the Punjab, are absolutely dependent upon the floods of the Indus. Sind has been compared to Egypt, and the Indus to the Nile; but, in truth, the case of the Indian province is the less favourable of the two. In Sind the average rainfall is barely 10 inches in the year, the soil is a thirsty sand, and, above all, the river does not run in confined banks, but wanders at its will over a wide valley. The rising of the Nile is a beneficent phenomenon, whose effects can be calculated with tolerable precision, and which the industry of countless generations has brought under control for the purposes of cultivation. In Sind the inundation is an uncontrolled torrent, which oftentimes does as much harm as good. Broadly speaking, no crop can be grown in Sind except under irrigation, and therefore the total cultivated area of about 3 million acres may be regarded as entirely dependent upon artificial water-supply. The supply is derived from the river by two main classes of canals —(1) inundation channels, which only fill when the Indus is in flood, and (2) perennial channels, which carry off water by means of dams at all seasons of the year. The former are for the most part the work of ancient rulers of the country, or of the cultivators themselves; the latter have been constructed since the British conquest. In both cases care has been taken to utilize abandoned channels of the river. It is impossible to present a complete view of the results of irrigation, for in some provinces, as in Sind, it is treated as a department of land administration, while in others it is almost entirely conducted by private enterprise.

In 1876–77 about 900,000 acres in Sind were returned as irrigated from works for which capital and revenue accounts are kept, the chief being the Ghár, Eastern and Western Nárá, Sakhar (Sukkur), Phuleli, and Pinyari; the total receipts were about £190,000, almost entirely credited under the head of land revenue. In the same year about 445,000 acres were irrigated from works of which revenue accounts only are kept, yielding about £75,000 in land revenue. Throughout the remainder of the Bombay presidency irrigation is conducted on a comparatively small scale, and mainly by private enterprise. In the Concan, along the coast, the heavy local rainfall and the annual flooding of the numerous small creeks permit rice to be grown without artificial aid. In Guzerat the supply is drawn from wells, and in the Deccan from tanks; but both these are liable to fail in years of deficient rainfall. Government has now undertaken a few comprehensive schemes of irrigation, which mostly conform to a common type—damming up the end of a hill valley so as to form an immense reservoir, and then conducting the water over the fields by channels, which are in some cases of considerable length. In 1876–77 the total area in Bombay (excluding Sind) irrigated from Government works was about 180,000 acres, yielding a revenue of about £42,000. In the same year the total expenditure on irrigation (inclusive of Sind) was £235,000,—£65,000 under the head of extraordinary and £170,000 of ordinary outlay.

In some parts of the Punjab irrigation is only one degree less necessary than in Sind, but the sources of supply are more numerous. In the northern tract, under the Himálayas, and in the upper valleys of the rivers, water can be obtained by digging wells from 10 to 30 feet below the surface. In the south, towards Sind, inundation channels are usual; while the upland tracts that rise between the basins of the main rivers are now in course of being supplied by the perennial canals of the Government. According to the returns for 1877–78, out of a grand total of 22,640,894 acres under cultivation, 5,000,481 were irrigated by private individuals and 1,618,854 by public channels, giving a total under irrigation of 6,619,335 acres, or 29 per cent of the cultivated area. The principal Government works are the Western Jumna canal, the Barí Doáb canal, and the Sirhind, the last of which, with the largest expenditure of all, is still incomplete. Up to the close of 1877–78 the total outlay had been £3,645,189; the total income in that year was £263,053, of which £171,504 was classified as direct and £91,549 as indirect; the total revenue charges on works in operation were £224,316, of which £146,419 was for maintenance and £77,897 for interest, thus showing a surplus of £38,737. On the Western Jumna canal alone the net profit was £83,112.

The North-Western Provinces present in the great *doáb*, or high land between the Ganges and the Jumna, a continuation of the physical features to be found in the Upper Punjab. The local rainfall, indeed, is higher, but before the days of artificial irrigation occasional deficiency repeatedly resulted in terrible famines. It is in this tract that the British Government has been perhaps most successful in averting the calamity of drought. In Sind irrigation is an absolute necessity; in Lower Bengal it may be regarded almost as a luxury; but in the great river basins of Upper India it serves the twofold object of saving the population from the vicissitudes of the season and of introducing more valuable crops and a higher stage of agriculture. Concerning private irrigation from wells in the North-Western Provinces no information is available. The great Government works are the Ganges canal, the Eastern Jumna canal, the Agra canals, and the Lower Ganges canal, the last of which is not yet complete. Up to the close of 1877–78 the total outlay had been £5,673,401. The gross income in that year was £438,136, of which £337,842 was derived from water rates and £100,294 from enhanced land revenue; the working expenses amounted to £143,984, leaving £294,152 for surplus profits, or 6·77 per cent. on the total capital expended on works in operation. The total area irrigated was 1,461,428 acres, of which more than two-thirds were supplied by the Ganges canal. Of the total area, 415,659 acres were under wheat and 139,374 under sugar-cane.

Into Oudh no irrigation works have yet been introduced by Government. A tolerable local rainfall, the annual overflow of the rivers, and an abundance of low-lying swamps combine to furnish a water supply that is ample in all ordinary years. According to the settlement returns, out of a total cultivated area of 8,276,174 acres, 2,957,397 acres, or nearly 36 per cent., are irrigated by private individuals; but this figure must include low lands watered by natural overflow.

Throughout the greater part of Bengal there is no demand for artificial irrigation, but the solicitude of Government has undertaken to construct works in those exceptional tracts where experience has shown that occasional drought is to be feared. In the lower valleys of the Ganges and the Brahmaputra, and along the deltaic seaboard, flood is a more formidable enemy than drought, and embankments there take the place of canals. The Public Works Department has altogether about 2800 miles of embankments under its charge, upon which £79,105 was expended in 1877–78, either as direct outlay or in advances to landowners. The broad strip of northern Bengal and Behar, stretching between the Himálayas and the Ganges, is also rarely visited by drought; though, when drought does come, the excessive density of the population brings the danger of famine very near. In Sáran alone it has been found necessary to carry out a comparatively small scheme for utilizing the discharge of the river Gandak. The great irrigation works in Bengal are two in number, and belong to two different types. (1.) In the delta of Orissa an extensive system of canals has been constructed on the pattern of those lower down on the Coromandel coast, which are intended to avert the danger of both drought and flood, and also to be useful for navigation. In average seasons, *i.e.*, in five years out of six, the local rainfall is sufficient for the rice crop, which is there the sole staple of cultivation; and therefore it is not to be expected that these canals will be directly remunerative. But on the other hand, if they save the province from a repetition of the disastrous year 1865–66, the money will not have been expended in vain. (2.) In South Behar the flood discharge of the Son has been intercepted, after the system of engineering followed in the North-West, so as to irrigate a comparatively thirsty strip of land extending along the south bank of the Ganges, where distress has ere now been severely felt. In this case also, the expenditure must be regarded rather as an insurance fund against famine than as reproductive outlay. The works are not yet complete, but the experience already gained proves that irrigation is wanted even in ordinary seasons. Up to the close of 1877-78 the total expenditure on capital account for all the irrigation works in Bengal was £4,653,903; the gross income for the year was £49,477; the working expenses were £70,286; and the estimated interest on capital, at 4½ per cent., amounted to £203,971, thus showing a net deficit of £224,780. The area irrigated was about 400,000 acres.

In the Madras presidency, and generally throughout southern India, facilities for irrigation assume a decisive importance in determining the character of agriculture. Crops dependent on the rainfall are distinguished as "dry crops," comprehending the large class of millets. Rice can only be grown on "wet land," which means land capable of being irrigated. Except on the Malabar or western coast, the local rainfall is nowhere sufficiently ample or sufficiently steady to secure an adequate water supply. Everywhere else water has to be brought to the fields from rivers, from tanks, or from wells. Out of the total cultivated area of Madras, only 15 per cent. is classified as "wet land;" the rest is at the mercy of the monsoons. From time immemorial an industrious population has made use of all the means available to store up the rainfall and direct the river floods over their fields. The upland areas are studded with tanks, which sometimes cover square miles of ground; the rivers are crossed by innumerable anicuts, or dams by which the floods are diverted into long aqueducts. Most of these works are now the property of Government, which annually expends large sums of money in maintenance and repairs, looking for remuneration only to the augmented land revenue. The average rate of assessment is 9s. 6d. per acre on irrigated land, as compared with only 2s. 3d. per acre on unirrigated land. It is, therefore, not only the duty but the manifest advantage of Government to extend the facilities for irrigation wherever the physical aspect of the country will permit. The deltas of the Godávari, the Kistna, and the Káveri (Cauvery) have within recent years been traversed by a network of canals and thus guaranteed against any risk of famine. Smaller works of a similar nature have been carried out in other places; while a private company, with a Government guarantee, has undertaken the more difficult task of utilizing on a grand scale the waters of the Tungabhadra amid the hills and vales of the interior. According to the latest statistics, the total irrigated area of the presidency is about 5 million acres, yielding a land revenue of about 2 millions sterling. Of this total, 1,680,178 acres, with a revenue of £739,778, are irrigated by eight great systems, for which revenue and capital accounts are kept. The minor works consist of about 35,000 tanks and irrigation canals, and about 1140 anicuts or dams across streams.

In Mysore, tanks, anicuts, and wells dug in the dry beds of rivers afford the means of irrigation, but wet cultivation is there even rarer than in Madras. After the disastrous famine of 1876-78 some comprehensive schemes of throwing embankments across river valleys were undertaken by Government. In the Central Provinces irrigation still remains a matter of private enterprise. According to the settlement returns, out of a total cultivated area of 13,610,503 acres, 804,370 acres, or 6 per cent., are irrigated by private individuals. The only Government work is a tank in the district of Nimár. In British Burmah, as in Lower Bengal, embankments take the place of canals, being classed as "irrigation works" in the annual reports. Within the last few years Government has spent about £318,000 under this heading, in order to save the low rice-fields along the Irawadi from destructive inundation.

The following figures, applying to India as a whole, partially show how the Government has performed its duty as a landlord in undertaking productive public works. During the ten years ending March 1878 a total sum of £10,457,702 was expended on irrigation under the budget heading of "extraordinary," as compared with £18,636,321 expended on state railways in the same period. In the twelve months ending at the same date irrigation yielded a gross income of £495,142, as compared with £548,528 derived from state railways; while £370,747 was charged to revenue account against irrigation and £420,754 against state railways.

Internal Communication.

Railways.—The existing system of railway communication in India dates from the administration of Lord Dalhousie, who brought to bear upon this question an experience gained at the Board of Trade when railway speculation in England was at its height. The first Indian line was projected in 1843 by Sir Macdonald Stephenson, who was afterwards active in forming the East India Railway Company; but that premature scheme was blighted by the financial panic that followed soon afterwards in England. Bombay, the city that has most benefited by railway enterprise, saw the first sod turned in 1850, and the first line of 3 miles to Tháná (Tanna) opened in 1853. The elaborate minute drawn up by Lord Dalhousie in the latter year still faithfully represents the railway map of India at the present day, though modified in detail by Lord Mayo's reform of 1869. Lord Dalhousie's scheme consisted of a few trunk lines, traversing the length and breadth of the peninsula, and connecting all the great cities and military cantonments. These trunk lines were to be constructed by private companies, to whom Government should guarantee a minimum of 5 per cent. interest on their capital expended, and from whom it should demand in return a certain measure of subordination. The system thus sketched out was promptly carried into execution, and by 1871 Bombay was put into direct railway communication with the sister presidencies of Calcutta and Madras. The task Lord Mayo had to undertake was the development of traffic by means of feeders which should tap the districts of production and thus open up the entire country. The means he determined to adopt was the construction of minor lines by the direct agency of the state, on a narrower gauge, and therefore at a cheaper rate, than the existing guaranteed railways. Railways

The guaranteed lines, including the East Indian, which was transferred to Government in 1879 in accordance with terms applicable to all alike, comprise the following:—the East Indian, running up the valley of the Ganges from Calcutta (Howrah) as far as Delhi, with a branch to Jabalpur; the Great Indian Peninsular, which starts from Bombay and sends one arm north-east to Jabalpur, with a branch to Nágpur, and another south-east to the frontier of Madras; the Madras line, with its terminus similarly at Madras city, and two arms running respectively to the Great Indian Peninsular junction at Ráichur and to Beypur on the opposite coast, with branches to Bangalore and Bellary; the Oudh and Rohilkhand, connecting Lucknow and Moradábád with Cawnpur and Benares; the Bombay, Baroda, and Central India, which runs due north from Bombay through the fertile plain of Guzerat, and is destined ultimately to be extended across Rájputána to Delhi; the Sind, Punjab, and Delhi, consisting of three sections, one in Lower Sind, another from Delhi to Lahore, and the third from Lahore to Múltán; the South Indian (the only one on the narrow gauge), in the extreme south, from Cape Comorin to Madras city; and the Eastern Bengal, traversing the richest portion of the Gangetic delta. The state lines are too numerous to be described singly. They include the extension from Lahore to Peshávar on the north-west frontier, which at present stops short at Jhelum; the "missing link," from Múltán to Hyderabad, thus bringing the Punjab into direct connexion with its natural seaport at Karáchi (opened throughout in 1878); the line up the valley of the Irawadi from Rangoon to Prome; and several short lines which have been constructed entirely at the expense of native states.

Statistics of Indian Railways for 1878.

	Miles. Open.	Capital Expended.	Number of Passengers.	Tons of Goods and Minerals.	Head of Live Stock.	Gross Receipts.	Gross Expenses.	Net Earnings.
Guaranteed railways	6044	£95,430,863	32,206,570	7,166,205	...	£9,503,721	£4,501,693	£5,002,028
State railways	2171	19,628,591	6,289,173	1,005,412	...	901,032	705,245	195,787
Totals	8215	£115,059,454	38,495,743	8,171,617	594,249	£10,404,753	£5,206,938	£5,197,815

These figures show 1 mile of railway to every 109 square miles of the area of British India, or to every 179 square miles of the area of the entire peninsula. The average cost of construction per mile is almost exactly £14,000. The guaranteed railways, embracing the great trunk lines throughout India, are on the "broad gauge" of 5 feet 6 inches; the state lines follow as a rule the narrow or metre gauge of 3·281 feet.

Roads.—As the railway system of India approaches its completion, the relative importance of the roads naturally

Roads. diminishes. From a military point of view, rapid communication by rail has now superseded the old marching routes as completely as in any European country. Like Portsmouth in England, Bombay in India has become the national harbour for the embarkation and debarkation of troops. On landing at Bombay, all troops proceed for a short rest to the healthy station of Deoláli on the plateau of the Deccan, whence they can reach their ultimate destinations, however remote, by easy railway stages. The Grand Trunk Road, running up the valley of the Ganges from Calcutta to the north-west frontier, which was first planned in the 16th century by the Afghán emperor Sher Sháh and was brought to completion under the administration of Lord George Bentinck, is now for the most part untrodden by troops. But though the railway system occupies the first place for military and commercial purposes, the actual mileage and economic importance of roads have greatly increased. They do not figure in the imperial balance-sheet, nor do they strike the popular imagination, but their construction and repair constitute two of the most important duties of the district official. A few lines, such as the continuation of the Grand Trunk Road in the Punjab, are still substitutes for the railways of the future. Others, which climb the passes of the Himálayas, the Western Gháts, or the Nílgiris, will probably never be superseded. The great majority, however, are works of local utility, serving to promote that ease and regularity of communication upon which the existence of civilization so largely depends. The substitution of the post-cart for the naked runner, and that of wheeled traffic for the pack-bullock, are silent revolutions effected under British rule.

The more important roads are all carefully metalled, the material employed in most provinces being *kankar* or calcareous limestone. In Lower Bengal and other deltaic tracts, where no kind of stone exists, bricks are roughly burnt and then broken up to supply metal for the roads. The minor streams are crossed by permanent bridges, with foundations of stone, and not unfrequently iron girders. The larger rivers have temporary bridges of boats thrown across them during the dry season, which give place to ferries in time of flood. Avenues of trees afford shade and material for timber. Most of these main lines are under the charge of the Public Works Department. The burden of maintaining the minor roads has, by a recent administrative reform, been thrown upon the local authorities, who depend for their pecuniary resources upon district committees and are often compelled to act as their own engineers. No statistics are available to show the total mileage of roads in British India, or the total sum expended on their maintenance.

River navigation. Inland navigation is almost confined to the four great rivers, the Ganges, the Brahmaputra, the Indus, and the Irawadi. These all flow through broad valleys, and from time immemorial have been the chief means of conveying the produce of the interior to the sea. South of the Gangetic basin there is not a single river that can be called navigable. Most of the streams in that tract, though mighty torrents in the rainy season, dwindle away to mere threads of water and stagnant pools during the rest of the year. The Godávari and the Narbadá, whose volume of water is ample, are both obstructed by rocky rapids which engineering skill has hitherto been unable to overcome. A total sum of 1½ millions sterling has been in vain expended upon the former river. Indeed, it may be doubted whether water carriage is able to compete, as regards the more valuable staples, with communication by rail. After the East Indian Railway was opened, steamers ceased to ply upon the Ganges; and the steam flotilla on the Indus similarly shrank to insignificance when through communication by rail became possible between Múltán and Karáchi. On the Brahmaputra and its tributary the Bárak, and on the Irawadi, steamers still run secure from competition. But it is in the Gangetic delta that river navigation attains its highest development. There the population may be regarded as half amphibious. Every village can be reached by water in the rainy season, and every family keeps its boat. The main channels of the Ganges and Brahmaputra and their larger tributaries are navigable all the year through. During the rainy months road-carriage is altogether superseded. All the minor streams are swollen by the rainfall on the hills, and the local downpour; while fleets of boats sail down with the produce that has accumulated in warehouses on the river banks. The statistics of this subject belong rather to the department of internal trade, but it may be mentioned here that the number of laden boats registered at certain of the river-stations in Bengal in the year 1877–78 was 401,729.

The great majority of the Bengal rivers require no attention from Government, but the system known as the three Nadiyá rivers is only kept open for traffic by close supervision. A staff of engineers is constantly employed to watch the shifting bed, to assist the scouring action of the current, and to advertize the trading community of the depth of water from time to time. In the year 1877–78 a total sum of £9522 was expended on this account, while an income of £32,494 was derived from tolls.

The artificial water channels of India may be divided into two classes—(1) those confined to navigation, and (2) those primarily constructed for purposes of irrigation. Of the former class the most important examples are to be found in the south of the peninsula. On both the Malabar and the Coromandel coasts the strip of lowland lying between the mountains and the sea affords natural facilities for the construction of an inland canal running parallel to the shore. In Malabar the salt-water lagoons or lakes, which form such a prominent feature in the local geography, merely required to be supplemented by a few cuttings to supply continuous water communication from the port of Calicut to Cape Comorin. On the east coast, the Buckingham canal, running north from Madras city as far as the delta of the Kistna, has been completed without any great engineering difficulties. In Bengal there are a few artificial canals of old date, but of no great magnitude, in the neighbourhood of Calcutta. The principal of these form the system known as the Calcutta and Eastern canals, which consist for the most part of natural channels, artificially deepened in order to afford a safe boat route through the Sundarbans. Up to the close of the year 1877–78 a capital sum of £360,332 had been expended by Government on these canals, and the gross income in that year was £44,120; after deducting cost of repairs, &c., charged to revenue account, and interest at the rate of 4½ per cent., a net profit was left amounting to £8748. The Hijlí tidal canal in Midnapur district, which cuts off a difficult corner of the Húglí (Hooghly) river, yielded a net revenue of £3171 in the same year.

Most of the great irrigation works, both in northern and southern India, have been so constructed as to be available also for navigation. The general features of these works have been already described. The works of the Madras Irrigation Company on the Tungabhadra were not made available for navigation until 1879. A scheme is now under the consideration of the Bengal Government for joining the Midnapur and Orissa canal systems, and extending the line of water communication farther southward through the Chilká Lake as far as Ganjám, 400 miles from Calcutta.

Commerce.

The trade of India may be considered under four heads:—(1) sea-borne trade with foreign countries; (2) coasting trade; (3) frontier trade, chiefly across the northern mountains; (4) internal traffic within the limits of the empire.

Sea-borne Trade.—With an extensive seaboard, India has but few ports. Calcutta monopolizes the commerce, not only of Lower Bengal, but of the entire basins of the Ganges and the Brahmaputra. Bombay is the sole outlet for the agricultural wealth of Guzerat, the Deccan, and the Central Provinces; while Karáchi (Kurrachee) performs a similar office for the Indus, and Rangoon for the Irawadi. The natural value of these four ports has been permanently confirmed by the construction of the main lines of railway communication. In the south of India only is sea-borne trade distributed along the coast. The western side has a succession of tolerable harbours, from Goa to Cochin. On the east there is not a single safe roadstead nor a navigable river, but ships anchor some distance off the shore at Madras, and at other points, generally near the mouths of the rivers. Of the total foreign trade of India, Calcutta and Bombay control about 40 per cent. each; Madras has 6 per cent., Rangoon 4 per cent., and Karáchi 2 per cent., leaving a balance of only 8 per cent. for all the remaining ports of the country. Calcutta and Bombay may be called the two centres of collection and distribution, to a degree without a parallel in other countries; and the growth of their prosperity is identical with the development of Indian commerce.

Foreign Trade of India for Forty Years, classified according to Quinquennial Periods, in Millions Sterling.

Periods.	Average Imports.			Average Exports.			
	Cotton Manufactures.	Total Merchandise.	Treasure.	Raw Cotton.	Total Merchandise.	Treasure.	Balance of Trade including Treasure.[1]
1840-44	3·19	7·69	2·76	2·34	14·14	0·48	+ 4·17
1845-49	3·76	9·14	3·07	1·68	15·68	1·32	+ 4·79
1850-54	5·15	11·06	4·79	3·14	19·02	1·00	+ 4·17
1855-59	6·94	15·58	11·27	3·11	24·93	0·92	− 1·00
1860-64	10·92	23·97	17·09	15·56	42·15	1·02	+ 2·11

1870-74	17·56	33·04	8·26	17·41	56·25	1·59	+16·54
1875-79	18·89	38·36	9·86	11·52	60·32	2·81	+14·91
General Average.	10·27	21·32	9·34	10·09	36·04	1·37	+ 6·75

The preceding table, which has been compiled from materials furnished by the *Parliamentary Abstract* for 1879, demands a few words of explanation. The average of quinquennial periods has been taken in order to counteract, as far as possible, accidental fluctuations. The two columns giving the imports of treasure and the exports of raw cotton both show exceptional increases between 1855 and 1869, due mainly to the effects of the Mutiny and of the American War. Far more instructive are the three columns giving the imports of cotton manufactures and of total merchandise and the exports of total merchandise. Each of these three, without exception, exhibits a progressive increase in every one of the eight quinquennial periods. In the full period of forty years the value of cotton goods imported has multiplied sixfold; the value of total merchandise imported has multiplied fivefold; and the value of total merchandise exported has multiplied more than fourfold.

Before examining in detail the history of some of the chief staples of trade, it may be convenient to give in this place the statistics of a single year,—1877-1878, which was a year of inflation, despite the incidence of famine in southern India. In 1877-78 the aggregate volume of foreign sea-borne trade exceeded 126 millions sterling in value. The transactions of Government show an import of £2,138,182 and an export of £36,615. The imports of merchandise were £39,336,003, and of treasure £17,355,460; total imports, £56,691,463. The exports of merchandise were £65,185,713, and of treasure £2,155,136; total exports, £67,340,849. These figures show an excess of exports over imports (including treasure) amounting to £8,494,250, and an excess of treasure imported to the amount of £15,200,324. The total number of vessels that entered and cleared was 12,537, with an aggregate of 5,754,379 tons, or an average of 459 tons each. Of the total tonnage 76 per cent. was British, 7 per cent. British Indian, 4 per cent. native, and 13 per cent. foreign,—American, Italian, and French being best represented in the latter class. There was also a land-borne frontier trade estimated at 7¾ millions—imports into India 4¼ millions, exports 3½ millions. The grand total of the land-borne and sea-borne foreign trade of India in 1878, was 134 millions.

The following tables give the principal items, together with the totals, of import and export for 1877-78, showing the quantities wherever possible, as well as the values:—

[1] The *plus* sign (+) stands for excess of exports, or so-called favourable balance of trade; the *minus* sign (−) stands for excess of imports.

Foreign Trade of British India in 1877-78.

Principal imports

As regards the imports, the first thing to notice is the enormous predominance of two items—cotton goods and treasure. On an average of the last forty years, cotton goods form 33 per cent., or exactly one-third of the total, and treasure an additional 30 per cent. Next in order come metals (copper, which is largely used by native smiths, slightly exceeding iron); Government stores, including munitions of war, boots, liquor, and clothing for soldiers, and railway plant; liquors, entirely for European consumption; coal, for the use of the railways and mills; railway plant for the guaranteed companies; provisions, machinery and mill-work, and manufactured silk. It will thus be seen that, with the single exception of Manchester goods, no articles of European manufacture are in demand for native consumption, but only for the needs of the civilized administration, and no raw produce, except copper, iron, and salt.

Cotton goods. Considering that England's export trade with India thus mainly depends upon piece-goods, it is curious to recollect the history of cotton manufacture. In the beginning of the 17th century the industry had not been introduced into England, and whatever demand there was for cotton in that country was satisfied by circuitous importations from India itself, where cotton-weaving is an immemorial industry. In 1641 "Manchester cottons," in imitation of Indian calicoes and chintzes, were still made of wool. Cotton is said to have been first manufactured in England in 1676. To foster the nascent industry, a succession of statutes were passed prohibiting the wear of imported cottons; and it was not until after the inventions of Arkwright and others and the application of steam as a motive power had secured to Manchester the advantage of cheap production that these protective measures were entirely removed. In the present century Lancashire has rapidly distanced her instructors. During the five years 1840–45 the annual import of cotton manufactures into India averaged a little over £3,000,000 sterling. In each subsequent quinquennial period there has been a steady increase, until in the year 1877–78 the import reached the unprecedented total of £20,000,000 sterling, or an increase of more than sixfold in less than forty years.

Treasure. The importation of treasure is perhaps still more extraordinary, when we bear in mind that it is not consumed in the using, but remains permanently in the country. During the same period of forty years the net import of treasure, deducting export, has reached the enormous aggregate of just 319 millions sterling, or more than £1, 6s. 6d. per head of the 240 million inhabitants of the peninsula. Of course, by far the larger portion of this was silver, but the figures for gold are by no means inconsiderable. During the ten years ending with 1875, when the normal value of silver in terms of gold was but little disturbed, the total net imports of treasure into India amounted to just 99 millions; of this total $62\frac{1}{2}$ millions were in silver and $36\frac{1}{2}$ millions in gold, the proportion of the latter metal being thus considerably more than one-third of the whole. On separating the re-exports from the imports, the attraction of gold to India appears yet more marked. Of the total imports of gold only 7 per cent. was re-exported, while for silver the corresponding proportion was 19 per cent. Roughly speaking, it may be concluded that India then absorbed about £3,000,000 sterling of gold a year. The supply is drawn chiefly from China, Ceylon, Great Britain, and Australia. The depreciation of silver that has since taken place has caused an enormous increase in the import of silver and a corresponding increase in the export of gold. The figures since 1876 do not show the normal state of things. But even in 1877–78, when the value of silver was at its lowest, though India drew upon its hoards of gold for export to the amount of more than 1 million sterling, it yet imported more than $1\frac{1}{2}$ millions, showing a net import of half a million of gold. It has been estimated that the gold circulation of India amounts to about 1,620,000 gold *mohars*, as compared with £158,000,000 of silver and £2,960,000 of copper. In addition, 10 million sovereigns are said to be hoarded in India, mainly in the Bombay presidency, where the impression of St George and the Dragon is valued on religious grounds.

Exports. When we turn to the exports, the changes that have taken place in relative magnitude demand notice.

In 1877–78 raw cotton for the first time for many years falls into the second place, being surpassed by the aggregate total of food grains; oil-seeds show as a formidable competitor to cotton; jute surpasses indigo, and tea comes close behind; while cotton manufactures are nearly as valuable as coffee. The imports of sugar, in value though not in quantity, exceed the exports; the trade in raw silk is about equally balanced; while spices, once the glory of Eastern trade, were exported to the value of only £226,515, as compared with imports more valuable and also twofold larger.

R co The export of raw cotton has been subject to excessive variations. At the close of the last century cotton was sent to England in small quantities, chiefly the produce of the Central Provinces, collected at Mírzápur and shipped at Calcutta, or the produce of Guzerat, despatched from Surat. In the year 1805 the total export of cotton from Surat was valued at £108,000; in the same year the English returns show only 2000 bales of East Indian cotton imported into Great Britain. But this figure was far below the average, for by 1810 the corresponding number of bales had risen to 79,000, to sink again to 2000 in 1813, and to rise to 248,000 in 1818. Bombay did not begin to participate in this trade until 1825, but has now acquired the practical monopoly, since the railway has diverted to the west the produce of the Central Provinces. In 1834, when the commerce of India was first thrown open, 33,000,000 lb were exported. Analysing the exports of cotton during the forty years since 1840, we find that in the first quinquennial period they averaged $2\frac{1}{4}$ millions sterling in value, and did not rise perceptibly until 1858, when they first touched 4 millions. From that date the increase was steady, even before the American exports were cut off by war in 1861. India then made the most of her opportunity, though quantity and quality did not keep pace with the augmented price. The highest figures of value was attained with $37\frac{1}{2}$ millions sterling in 1865, and the highest figure of quantity with 803,000,000 lb in 1866. Thenceforth the decline has been constant, though somewhat irregular, the lowest figures both of quantity and value being those of 1878–79. The most recent feature of the trade is the comparatively small amount shipped to the United Kingdom, and the even distribution of the rest among Continental ports. The export of raw cotton in 1878–79 amounted to £7,914,091, and of twist and cotton goods to £2,581,823.

J Second in importance to cotton as a raw material of British manufacture comes jute, the trade in which is a creation of less than thirty years. At the time of the London Exhibition of 1851 jute fibre was practically untried and unknown, while attention was even then actively drawn to rhea or China grass, which remains to the present day unmanageable by any cheap process. From time immemorial jute has been grown in the swamps of Eastern Bengal, and has been woven into coarse fabrics for bags and even clothing. As early as 1795 Dr Roxburgh called attention to the commercial value of the plant, which he grew in the Botanical Gardens of Calcutta and named "jute," after the language of his Orissa gardeners, the Bengalí word being *pát* or *koshta*. In 1828–29 the total exports of jute were only 364 cwts., valued at £62. From that date the trade steadily grew, until in the quinquennial period ending 1847–48 the exports averaged 234,055 cwts. The Crimean war, which cut off the supplies of Russian flax and hemp from the Forfarshire weavers, made the reputation of jute. Taking quinquennial periods, the export of jute rose from an average of 969,724 cwts. in 1858–63 to 2,628,100 cwts. in 1863–68 and 4,858,162 cwts. in 1868–73. The highest figures reached were in the year 1872–73, with 7,080,912 cwts., valued at £4,142,548. The export of raw jute in 1878–79 reached £3,800,426, and of manufactured jute £1,098,434.

Ri wl The export of grain, as already noticed, is now in the aggregate larger than that of cotton. The two chief items are rice and wheat. Rice is exported from British Burmah, from Bengal, and from Madras. From the point of view of the English produce market rice means only Burmese rice, which is annually exported to the large amount of about 12 million cwts., valued at 3 millions sterling. In the Indian tables this is all entered as consigned to the United Kingdom, though, as a matter of fact, the rice fleets from Burmah only call for orders at Falmouth, and are thence diverted to various English or Continental ports. India has a practical monopoly of the European market. An export duty is levied on rice in India at the rate of 3 *ánnás* per *maund*, or about 6d. per cwt. A similar duty on wheat was repealed in 1875, and that trade has since conspicuously advanced. In 1874–75 the export of wheat was about 1 million cwts. Forthwith it increased year by year, until in 1877–78 it exceeded $6\frac{1}{4}$ million cwts., valued at nearly 3 millions sterling. In the following year the quantity fell away to almost nothing, owing to the general failure of the harvest in the producing districts. The Punjab is the principal wheat-growing tract in India, but hitherto the chief supplies have come from the North-Western Provinces and Oudh, being collected at Cawnpur and thence despatched by rail to Calcutta. The total export of grains in 1879 was valued at £9,802,363.

Oil Oil-seeds, also, were freed in 1875, the duty previous to that date having been 3 per cent. *ad valorem*. Ten years before, the average export was only about 4 million cwts. a year; but the fiscal change, coinciding with an augmented demand in Europe, has caused an increase of threefold. In 1877-78 the total export amounted to 12,187,020 cwts., valued at more than 7¼ millions sterling. Of this Bengal contributed 7,799,220 cwts., and Bombay 3,179,475 cwts. Linseed and rape are consigned mainly to the United Kingdom, while France takes almost the entire quantity of *til* or gingelly. The export of oil-seeds in 1878-79 was valued at £4,682,512.

In actual amount, though not in relative importance, indigo holds its own in the face of competition from aniline dyes. The export of 1877-78 amounted to 120,605 cwts., valued at £3,494,334, being the highest figures on record. Of this total Bengal yielded 99,402 cwts., and Madras 16,899 cwts. In 1878-79 the export of indigo amounted to 105,051 cwts., valued at £2,960,463. The most noticeable feature in this trade is the diminishing proportion sent direct to England, and the wide distribution of the remainder. Of other dyes, safflower has greatly fallen off, being now only in demand for a rouge in China and Japan; the export in 1877-78 was 3698 cwts., valued at £14,881. The export of myrobalans, on the other hand, was greatly stimulated by the Russo-Turkish war, which interrupted the supply of valonia and galls from Asia Minor. The quantity rose from 286,350 cwts. in 1875-76 to 537,055 cwts. in 1877-78, valued in the latter year at £230,526. Practically the whole is sent to the United Kingdom. Turmeric, also, exhibits an increase to 146,865 cwts. in 1877-78, valued at £123,766, of which the United Kingdom took about one-half. Lac-dye, like other kinds of lac, shows a depressed trade, the exports in 1877-78 having been 9570 cwts., valued at £29,009.

No other export has made such steady progress as tea, which has multiplied more than fourfold in the space of ten years. In 1867-68 the amount was only 7,811,429 ℔; by 1872-73 it had reached 17,920,439 ℔; and in 1878-79, without a single step of retrogression, it had further risen to 34,800,027 ℔, valued at £3,170,118. Indian tea has now a recognized position in the London market, generally averaging about 4d. per ℔ higher in value than Chinese tea, but it has failed to win acceptance in most other countries, excepting Australia. The exports of coffee from India are stationary, if not declining. The highest amount during the past ten years was 507,296 cwts. in 1871-72, the lowest amount 298,587 cwts. in 1877-78, valued at £1,338,499. In 1878-79 the export was 342,268 cwts., valued at £1,548,481.

Of manufactured goods, cotton and jute deserve notice, though by far the greater part of the produce of the Indian mills is consumed locally. The total value of cotton goods exported in 1878-79 was £1,644,125, being an increase of nearly threefold as compared with 1874-75. The exports of twist and yarn, spun in the Bombay mills, increased from 3 million ℔ in 1874-75 to 15½ million ℔ in 1877-78, valued in the latter year at £682,058. The chief places of destination were—China, 13,762,133 ℔; Aden, 1,181,120 ℔; and Arabia, 393,371 ℔. The export of twist and yarn in 1878-79 was valued at £937,698. Piece-goods belong to two classes. Coloured goods, woven in hand-looms, are exported from Madras to Ceylon and the Straits, to the annual value of about £230,000, the quantity being about 8 million yards; while in 1877-78 grey goods from the Bombay mills were sent to Aden, Arabia, Zanzibar, and the Mekran coast, amounting to over 10 million yards, and valued at £141,509. Jute manufactures consist of gunny bags, gunny cloths, and rope and twine, almost entirely the produce of the Calcutta mills. In all of these the value of the exports is increasing faster than the quantity, having multiplied nearly fourfold in the last five years. In 1877-78 the total export of jute manufactures was valued at £771,127, and in 1878-79 at £1,098,434. Gunny bags, for the packing of wheat, rice, and wool, were exported in 1877-78 to the number of more than 26½ millions, valued at £729,669. Of this total £298,000 (including by far the most valuable bags) was sent to Australia, £162,000 to the Straits, £80,000 to the United States, £77,000 to Egypt, £32,000 to China, and £81,000 to other countries, this comprising a considerable quantity destined for England. In 1878-79 the export of gunny bags had increased to 45¾ millions, valued at a million sterling. Of gunny cloth in pieces nearly 3 million yards were exported in 1877-78, almost entirely to the United States, valued at £35,610; in 1878-79 these exports had increased to upwards of 4⅝ million yards. Of rope and twine 4428 cwts. were exported, valued at £5443.

The following tables, being taken from Indian returns, do not in all cases show the real origin of the imports or the ultimate destination of the exports, but primarily the countries with which India has direct dealings. London still retains its historical pre-eminence as the first Oriental mart in the world, whither buyers flock from the other countries of Europe to satisfy their wants. Germans go there for wool, Frenchmen for jute, and all nations alike for rare dyes, spices, and drugs. Though the opening of the Suez Canal has restored to the maritime cities of the Mediterranean some share of the business that they once monopolized, yet, on the other hand, the advantage of prior possession, the growing use of steamers, and the certainty of being able to obtain a return freight, all tend to favour trade with England carried in English bottoms. As the result of these conflicting influences, the trade of India with the United Kingdom, while in actual amount it remains pretty constant, shows a relative decrease as compared with the total trade.

Distribution of Principal Exports of Raw Produce in 1877-78, *in Cwts.*

The opening of the Suez Canal in 1869, while it has stimulated every department of trade into greater activity, has not materially changed its character. As might be anticipated, the imports, being for the most part of small bulk and high value, first felt the advantages of this route. In 1875-76 as much as 85 per cent. of the imports from Europe and Egypt (excluding treasure) passed through the canal, but only 29 per cent. of the exports. In 1878-79 the proportion of imports was substantially the same, while that of exports had risen to 64 per cent., showing that such bulky commodities as cotton, grain, oil-seeds, and jute were beginning to participate in the advantages of rapid traffic. The actual values of canal trade in 1877-78, the year of its greatest development, were 29 millions sterling for imports, and 23 millions for exports. It is estimated that the canal has reduced the length of the voyage from London to India by the equivalent of thirty-six days, the route round the Cape being more than 11,000 miles, that through the canal less than 3000 miles.

In 1873-74, which may be regarded as a normal year, though the figures are not altogether free from suspicion, the total number of vessels engaged in the coasting trade that cleared and entered was 294,374, with an aggregate of 10,379,862 tons; the total value of both exports and imports was returned at £34,890,445. Of the total number of vessels, 280,913, with 4,843,668 tons, were native craft. Bombay and Madras divide between them nearly all the native craft; while in Bengal and Burmah a large and increasing proportion of the coasting traffic is carried in British steamers. In 1877-78, the year of famine, the number of ships increased to 319,624, the tonnage to 15,732,246 tons, and the value to £67,814,446. By far the largest item was grain, of which a total of 1,137,690 tons, valued at 13 millions sterling, was thrown into the famine-stricken districts from the seaboard. Next in importance come raw cotton and cotton goods. The trade in raw cotton amounted to 387,438 cwts., valued at £957,900, much of which was merely transshipped from one port to another in the Bombay presidency. Cotton, twist, and yarn amounted to 17,425,993 ℔, valued at £965,038, of which the greater part was sent from Bombay to Bengal and Madras. The total value of the cotton piece-goods was £620,866, including about 24 million yards of grey goods sent from Bombay to Bengal and to Sind in nearly equal proportions, and about 2 million yards of coloured goods from Madras. Stimulated by the activity of the grain trade, the exports of gunny bags from Calcutta coastwise rose to a total value of nearly

£960,000. The trade in betel-nuts amounted to nearly 44 million lb, valued at over £500,000. Burmah consumes most of these, obtaining its supplies from Bengal; while Bombay gets considerable quantities from Madras, from the Concan and Goa, and from Bengal. Sugar (refined and unrefined) figures to the large amount of £900,000, of which the greater part came from Bengal. The movements of treasure coastwise show a total of just 5 millions sterling, being exceptionally augmented by the conveyance of silver to Burmah in payment for rice supplied to Madras.

Frontier trade. The following table exhibits the totals of the trade conducted along the landward frontier of the Indian empire, so far as figures are available:—

Registered Frontier Trade of India in 1877–1878.

	Imports.	Exports.	Total.
	£	£	£
Afghánistán and adjoining hill tribes, ...	671,000	718,000	1,389,000
Kashmír, Ladákh, and Tibet	630,000	374,000	1,004,000
Nepál	1,054,000	633,000	1,687,000
North-East Frontier tribes	77,000	30,000	107,000
Independent Burmah	1,664,000	1,762,000	3,426,000
Siam	69,000	57,000	126,000
Total..................	4,165,000	3,574,000	7,739,000

Internal trade. In any community raised above primitive barbarism the aggregate volume of its internal trade must be far greater than that of its foreign commerce; but, from the nature of the case, it is impossible to estimate its amount or even to describe adequately its general character. On the one hand, there is the wholesale business connected with foreign commerce in its earliest stages—the collection of agricultural produce from a thousand little villages, its accumulation at a few great central marts, and its despatch to the seaboard; in return for which manufactured articles are distributed by the same channels, though in the reverse direction. On the other hand, there is the interchange of commodities of native growth and manufacture, sometimes between neighbours, but also between distant provinces. With a few unimportant exceptions, free trade is the rule throughout the vast peninsula of India, by land as well as by sea. The Hindus possess a natural genius for commerce, as is shown by the daring with which they have penetrated into the heart of Central Asia, and to the east coast of Africa. Among the benefits which British rule has conferred upon them is the removal of the innumerable shackles that a short-sighted despotism had imposed upon their talents.

Trading classes. Broadly speaking, the greater part of the internal trade remains in the hands of the natives. Europeans control the shipping business, and have a share in the collection of some of the more valuable staples of exports, such as cotton, jute, oil-seeds, and wheat. But the work of distribution and the adaptation of the supply to the demand of the consumer naturally fall to those who are best acquainted with native wants. Even in the presidency towns the retail shops are generally owned by natives. The Vaisya, or trading caste of Manu, has no longer any separate existence; but its place is occupied by several well-marked classes. On the western coast the Pársis, by the boldness and extent of their operations, tread close upon the heels of the most prosperous English houses. In the interior of the Bombay presidency, business is mainly divided between two classes, the Baniyas of Guzerat and the Márwárís from Rájputána. Each of these profess a peculiar form of religion, the former being Vishnuvites of the Vallabhácharí sect, the latter Jains. In the Deccan their place is taken by Lingáyats from the south, who again follow their own form of Hinduism, which is an heretical species of Siva worship. Throughout Mysore, and in the north of Madras, Lingáyats are still found, but along the eastern sea-board the predominating classes of traders are those named Chetties and Komatis. In Bengal many of the upper castes of Súdras have devoted themselves to general trade; but there again the Jain Márwárís from Rájputána and the North-West occupy the front rank. Their head-quarters are in Murshidábád district, and their agents are to be found throughout the valley of the Brahmaputra, as far up as the unexplored frontier of China. They penetrate everywhere among the wild tribes; and it is said that the natives of the Khásí hills are the only hillmen who do their own business of buying and selling. In the North-Western Provinces and Oudh the traders are generically called Baniyas; and in the Punjab are found the Khatrís, who have perhaps the best title of any to regard themselves as descendants of the original Vaisyas. According to the general census of 1872, the total number of persons in all India returned as connected with commerce and trade was 3,224,000, or 5·2 per cent. of the adult males.

Local trade. Local trade is conducted either at the permanent *bázárs* of great towns, at weekly markets held in certain villages, at annual gatherings primarily held for religious purposes, or by means of travelling brokers and agents. The cultivator himself, who is the chief producer and also the chief customer, knows little of the great towns, and expects the dealer to come to his own door. Each village has at least one resident trader, who usually combines in his own person the functions of money-lender, grain dealer, and cloth seller. The simple system of rural economy is entirely based upon the dealings of this man, whom it is the fashion sometimes to decry as a usurer, but who is really the one thrifty person among an improvident population. Abolish the money-lender, and the general body of cultivators would have nothing to depend upon but the harvest of a single year. The money-lender deals chiefly in grain and in specie. In those districts where the staples of export are largely grown, the cultivators commonly sell their crops to travelling brokers, who re-sell to larger dealers, and so on until the commodities reach the hands of the agents of the great shipping houses. The wholesale trade thus rests ultimately with a comparatively small number of persons, who have agencies, or rather corresponding firms, at the great central marts. Buying and selling in their aspects most characteristic of India are to be seen, not at these great towns, nor even at the weekly markets, but at the fairs which are held periodically at certain spots in most districts. Religion is always the original pretext of these gatherings or *melás*, at some of which nothing is done beyond bathing in the river, or performing various superstitious ceremonies. But in the majority of cases religion has become a mere excuse for secular business. Crowds of petty traders attend, bringing all those miscellaneous articles that can be packed into a pedlar's wallet; and the neighbouring villagers look forward to the occasion to satisfy alike their curiosity and their household wants.

Provincial trade. It is, of course, impossible to express accurately in figures the extent of internal trade, but the following statistics will serve in some measure to show both its recent development and its actual amount. They are based upon the registration returns that have been collected for some years past in certain provinces. In 1863–64 the total external trade of the Central Provinces, both export and import, was estimated to amount to 102,000 tons, valued at £3,909,000. By 1868–69, after the opening of the Jabalpur through railway, it had increased to 209,000 tons, valued at £6,795,000. In 1877–78, the year of famine in southern India, the corresponding figures were 635,000 tons and £9,373,000, showing an increase in fourteen years of more than sixfold in quantity, and considerably more than twofold in value. The comparatively small increase in value is to be attributed to the exclusion from the later returns of opium, which merely passes through in transit from Málwá. In 1874–75 the total external trade of the Punjab amounted to about 600,000 tons, valued (but probably overvalued) at about £16,000,000. In 1877–78 it had increased to nearly 900,000 tons, valued at £17,500,000. The total trade of Behar in

1877–78 was valued at £16,000,000. But perhaps the significance of such enormous totals will become plainer if we take the case of a single mart, Patná, which may claim to be considered one of the most important centres of inland traffic in the world. Favourably situated on the Ganges, near the confluence of the Son and the Gogra, where the principal trade routes branch off to Nepál, it has become a great changing station for the transfer of goods from river to rail. In the year 1876–77 the total registered trade of Patná (excluding the Government monopoly of opium, and probably omitting a good deal besides) was valued in the aggregate at 7¼ millions sterling. Many articles are included twice over, both as exported and imported, but the imports alone amounted to more than 4 millions. Among the principal items on one side or the other may be mentioned—European piece-goods, £1,217,000; indigo, £789,000; oil-seeds, £557,000; salt, £389,000; sugar, £274,000; food grains, £258,000; hides, £185,000; saltpetre, £156,000.

Manufactures.

Though India may be truly described as an agricultural and not a manufacturing country, yet it would be erroneous to infer that it is destitute of the arts of civilized life. It has no swarming hives of industry to compare with the factory centres of Lancashire, nor a large mining population, living under the soil rather than on it. In short, it has not reached that modern stage of industrial development which is based upon the use of coal and the discoveries of physical science. But in all manufactures requiring manual dexterity and artistic taste India may challenge comparison with England in the last century. The organization of Hindu society demands that the necessary arts, such as those of the weaver, the potter, and the smith, should be practised in every village. The pride and display of the rival kingdoms, into which the country was formerly divided, gave birth to many arts of luxury that have not yet been entirely forgotten in the decayed capitals. When the first European traders reached the coast of India in the 16th century, they found a civilization among both "Moors" and "Gentoos" at least as highly advanced as their own. In architecture, in fabrics of cotton and silk, in goldsmith's work and jewellery, the people of India were then unsurpassed. But while the East has stood still, or rather retrograded (for, in the face of keen competition, to stand still is to retrograde), the West has advanced with a gigantic stride which has no parallel in the history of human progress. On the one hand, the downfall of the native courts has deprived the skilled workman of his chief market, while, on the other, the English capitalist has enlisted in his service forces of nature against which the village artisans in vain try to compete. The fortunes of India are bound up with those of a country whose manufacturing supremacy depends upon a great export trade. The tide of circumstances, more inexorable than artificial enactments, has compelled the weaver to exchange his loom for the plough, and has crushed out a multitude of minor handicrafts. Political economy, judging only by the single test of cheapness, may approve the result; but the philosopher will regret the increasing uniformity of social conditions, and the loss to the world of artistic tendencies which can never be restored.

Historically the most interesting, and still the most important in the aggregate, of all Indian industries are those conducted in every rural village of the land. The Hindu village system is based upon division of labour quite as much as upon hereditary caste. The weaver, the potter, the blacksmith, the brazier, the oil-presser, are each members of a community, as well as inheritors of a family occupation. On the one hand, they have a secure market for their wares, and, on the other, their employers have a guarantee that their trades shall be well learned. Simplicity of life and permanence of employment are here happily combined with a high degree of excellence in design and honesty of execution. The stage of civilization below these village industries is represented by the hill tribes, especially those on the north-east frontier, where the weaving of clothes is done by the women of the family,—a practice which also prevails throughout Burmah. A higher stage may be found in those villages or towns which possess a little colony of weavers or braziers noted for some specialty. Yet one degree higher is the case of certain arts of luxury, such as ivory carving or the making of gold lace, which chance or royal patronage has fixed at some capital now perhaps falling into decay. One other form of native industry owes its origin to European interference. Many a village in Lower Bengal and on the Coromandel coast still shows traces of the time when the East India Company and its European rivals gathered large settlements of weavers round their little forts, and thus formed the only industrial towns that ever existed in India. But when the Company abandoned its manufacturing business in 1833, these centres of industry rapidly declined; and the once celebrated muslins of India have been driven out of the market of the world by Manchester goods.

Cotton weaving.

Cotton weaving may be called the oldest indigenous industry of India. The Greek name for cotton fabrics, *sindon* (σινδών), is etymologically the same as that of India or Sind; in later days Calicut on the Malabar coast has given us "calico." Cotton cloth, whether plain or ornamented, has always been the single material of clothing for both men and women, except in Assam and Burmah, where silk is preferred, perhaps in reminiscence of an extinct trade with China. When European adventurers found the way to India, cotton and silk always formed part of the rich cargoes they brought home. The English, in especial, appear to have been careful to fix their earliest settlements amid a weaving population—at Surat, at Calicut, at Masulipatam, at Hooghly. In delicacy of texture, in purity and fastness of colour, in grace of design, Indian cottons may still hold their own against the world; but in the matter of cheapness they have been unable to face the competition of Manchester.

In 1870 the Madras Board of Revenue published a valuable report upon hand-loom weaving, from which the following local figures are taken. The total number of looms at work in that presidency, with its general population of 31 millions, was returned at 279,220, of which 220,015 were in villages and 59,205 in towns, showing a considerable increase upon the corresponding number in 1861, when the *mohtarfa* or assessed tax upon looms was abolished. The total estimated consumption of twist was 31,422,712 ℔, being at the rate of 112 ℔ per loom. Of this amount, about one-third was imported twist and the remainder country-made. The total value of the cotton goods woven was returned at 3½ millions sterling, or £12, 10s. per loom, but this was believed to be much under the truth. The export of country-made cloth in the same year was about £220,000. In the Central Provinces (population 8 millions), where hand-loom weaving is still fairly maintained, and where statistics are more trustworthy than in other parts, the number of looms is returned at 87,588, employing 145,896 weavers, with an annual out-turn valued at £828,000. In 1878–79 the export of Indian piece-goods from the Central Provinces was valued at £162,642. As regards Bengal, hand-loom weaving is generally on the decline. The average consumption of piece-goods throughout the province is estimated at about 5s. per head, and the returns of registered trade show that European piece-goods are distributed from Calcutta at the rate of about 2s. 5d. per head. In Midnapur, Nadiyá, and Bardwán the native weavers still hold their own, appears from the large imports of European twist; but in the eastern districts, which have to balance their large exports of jute, rice, and oil-seeds, the imports of European cloth rise to the high figure of 2s. 7d. per head. No part of India has suffered more from English competition than Bombay, where, however, the introduction of steam machinery is beginning to restore the balance. Twist from the Bombay mills is now generally used by the hand-loom weavers of the presidency, and is largely exported to China. But it is in the finer fabrics produced for export that the west of India has suffered most. Taking Surat alone, the export by sea of piece-goods at the beginning of the century was valued at £360,000 a year. By 1845 the value had dropped to £67,000, rising again to £134,000 in 1859; but in 1874 it was only £4188.

Silk weaving.

Silk weaving is also a common industry everywhere, silk fabrics, or at least an admixture of silk in cotton, being universally affected as a mark of wealth. Throughout British Burmah, and also in Assam, silk is the common material of clothing, being made up by the women of the household. In Burmah the bulk of the silk is imported from China, generally in a raw state; but in Assam it is obtained from two or three varieties of worms, which are generally fed on jungle trees and may be regarded as semi-domesticated. Bengal is the only part of India where sericulture, or the rearing of the silk-worm proper on mulberry, can be said to flourish. The greater part of the silk is wound in European filatures, and exported in the raw state to Europe. The native supply is either locally consumed, or sent up the Ganges to the great cities of the North-West. A considerable quantity of raw silk, especially for Bombay consumption, is imported from China. *Tasar* silk, or that obtained from the cocoons of semi-domesticated worms, does not contribute much to the supply. As compared with cotton weaving, the manufacture of silk fabrics may be called a town and not a village industry. These fabrics are of two kinds—(1) those composed of pure silk, and (2) those with a cotton warp crossed by a woof of silk. Both kinds are often embroidered with gold and silver. The mixed fabrics are known as *mashru* or *sufi*, the latter word, meaning "permitted," being used because the strict ceremonial law will not allow Mahometans to wear clothing of pure silk. They are largely woven in the towns of the Punjab and Sind, at Agra, at Hyderabad in the Deccan, and at Tanjore and Trichinopoli. Pure silk fabrics are either of simple texture, or highly ornamented in the form of *kinkhabs* or brocades. The latter are a specialty of Benares, Murshidábád, Ahmadábád, and Trichinopoli. Printed silks are woven at Surat for the wear of Pársí and Guzerati women. Quite recently mills with steam machinery have been established at Bombay, which weave silk fabrics for the Burmese market, chiefly *lúngyís*, *tamains*, and *patsoes*. The silk manufactures exported from India consist almost entirely of the handkerchiefs known as *bandannas* and *corahs*, with a small proportion of *tasar* fabrics. The trade appears to be on the decline, the total exports having decreased from 2,468,052 yards, valued at £238,000, in 1875–76 to 1,481,256 yards, valued at £147,000, in 1877–78. But in 1879 the value had again risen to £195,897; and the returns for 1874–77 were unusually high.

Embroidery. Embroidery has already been referred to in the two preceding paragraphs. The groundwork may be either silk, cotton, wool, or leather. The ornament is woven in the loom, or sewn on afterwards with the needle. Muslin is embroidered with silk and gold thread at Dacca, Patná, and Delhi. Sind and Cutch (Kachhch) have special embroideries of coloured silk and gold. Leather-work is embroidered in Guzerat. In some of the historical capitals of the Deccan, such as Gulbargah and Aurangábád, velvet (*makhmal*) is gorgeously embroidered with gold, to make canopies, umbrellas, and housings for elephants and horses, for use on state occasions. Not only the goldsmith, but also the jeweller lends his aid to Indian embroidery.

Carpet weaving. Carpets and rugs may be classified into those made of cotton and those made of wool. The former, called *satranjis* and *daris*, are made chiefly in Bengal and northern India, and appear to be an indigenous manufacture. The woollen or pile carpets known as *kalin* and *kalicha* are those which have recently attained so much popularity in England, by reason of the low price at which the outturn of the jail manufactories can be placed in the market. The art was probably introduced into India by the Mahometans. The historical seats of the industry are in Kashmír, the Punjab, and Sind, and at Agra, Mírzápur, Jabalpur, Warangal in the Deccan, Malabar, and Masulipatam. Velvet carpets are also made at Benares and Murshidábád, and silk pile carpets at Tanjore and Salem. At the London Exhibition of 1851 the finest Indian rugs came from Warangal, the ancient capital of the Andhra dynasty, about 80 miles east of Hyderabad. Their characteristic feature was the exceedingly fine count of the stitches, about 12,000 to the square foot. "They were also perfectly harmonious in colour, and the only examples in which silk was used with an entirely satisfactory effect" (Birdwood). The price was not less than £10 per square yard. The common rugs, produced in enormous quantities in the jails at Lahore, Jabalpur, Mírzápur, Benares, and Bangalore, sell in England at 7s. 6d. each.

Jewellers' work. Gold and silver and jewels, both from their colour and their intrinsic value, have always been the favourite material of Oriental ornament. Even the hill tribes of Central India and the Himálayas have developed some skill in hammering silver into brooches and torques. Imitation of knotted grass and leaves seems to be the origin of the simplest and most common form of gold ornament, the early specimens consisting of thick gold wire twisted into bracelets, &c. A second archaic type of decoration is to be found in the chopped gold jewellery of Guzerat. That is made of gold lumps, either solid or hollow, in the form of cubes and octahedrons, strung together on red silk. Of artistic jeweller's work, the best known examples come from Trichinopoli, Cuttack, Delhi, and Kashmír. Throughout southern India the favourite design is that known as *swámi*, in which the ornamentation consists of figures of Hindu gods in high relief, either beaten out from the surface or fixed upon it by solder or screws. The hammered *repoussé* silver work of Cutch (Kachhch), though now entirely naturalized, is said to be of Dutch origin. Similar work is done at Lucknow and Dacca. The goldsmith's art contributes largely to embroidery, as has already been mentioned. Gold and silver thread is made by being drawn out under the application of heat. The operation is performed with such nicety that one rupee's worth of silver will make a thread nearly 800 yards long. Before being used in the loom this metallic thread is generally twisted with silk.

Precious stones are lavishly used by Indian jewellers, who care less for their purity and commercial value than for the general effect produced by a blaze of splendour. "But nothing can exceed the skill, artistic feeling, and effectiveness with which gems are used in India both in jewellery proper and in the jewelled decoration of arms and jade" (Birdwood).

Iron work. *Iron Work.*—The chief duty of the village smith is, of course, to make the agricultural implements for his fellow-villagers. But in many towns in India, often the sites of former capitals, iron work, especially in the manufacture of arms, still retains a high degree of artistic excellence.

Cutlery and arms. *Cutlery.*—The blade of the Indian *talwár* or sword is sometimes marvellously watered, and engraved with date and name, sometimes sculptured in half-relief with hunting scenes, sometimes shaped along the edge with teeth or notches like a saw. Matchlocks and other firearms are made at several towns in the Punjab and Sind, at Monghyr in Bengal, and at Vizianágaram in Madras. Chain armour, fine as lacework and said to be of Persian origin, is still manufactured in Kashmír, Rájputána, and Cutch (Kachhch). Ahmadnagar in Bombay is famous for its spear-heads. Both firearms and swords are often damascened in gold, and covered with precious stones. In fact, the characteristic of Indian arms, as opposed to those of other Oriental countries, is the elaborate goldwork hammered or cut upon them and the unsparing use of gems. Damascening on iron and steel, known as *kuft*, is chiefly practised in Kashmír, and at Guzerat and Siálkot in the Punjab. Damascening in silver, which is chiefly done upon bronze, is known as *bidari* work, from the ruined capital of Bidar in the nizám's dominions, where it is still chiefly carried on.

Brass and copper work.

Brass and Copper.—The village brazier, like the village smith, manufactures the necessary vessels for domestic use. Chief among these vessels is the *lota*, or globular bowl, universally used in ceremonial ablutions. The form of the *lota*, and even the style of ornamentation, has been handed down unaltered from the earliest times. Benares enjoys the first reputation in India for work in brass and copper. In the south, Madura and Tanjore have a similar fame; and in the west, Ahmadábád, Poona, and Násik. At Bombay itself large quantities of imported copper are wrought up by native braziers. The temple bells of India are well known for the depth and purity of their note. In many localities the braziers have a special repute either for a peculiar alloy or for a particular process of ornamentation. Silver is sometimes mixed with the brass, and in rarer cases gold. The brass or rather bell-metal ware of Murshidábád, known as *khágraí*, has more than a local reputation, owing to the large admixture of silver in it.

Pottery.

Pottery is made in almost every village, from the small vessels required in cooking to the large jars used for storing grain, and occasionally as floats to ferry persons across a swollen stream. But, though the industry is universal, it has hardly anywhere risen to the dignity of a fine art. Sind is the only province of India where the potter's craft is pursued with any regard to artistic considerations; and there the industry is said to have been introduced by the Mahometans. Sind pottery is of two kinds, encaustic tiles and vessels for domestic use. In both cases the colours are the same,—turquoise blue, copper green, dark purple, or golden brown, under an exquisitely transparent glaze. The usual ornament is a conventional flower pattern, pricked in from paper and dusted along the pricking. The tiles, which are evidently of the same origin as those of Persia and Turkey, are chiefly to be found in the ruined mosques and tombs of the old Musalmán dynasties; but the industry still survives at the little towns of Saidpur and Bubri. Artistic pottery is made at Hyderabad, Karáchi, Tatta, and Hála, and also across the border, at Lahore and Múltán in the Punjab. The Madura pottery also deserves mention from the elegance of its form and the richness of its colour. The North-Western Provinces have, among other specialties, an elegant black ware with designs in white metal worked into its surface.

Sculpture and carving.

Carving and Inlaying.—Stone sculpture is an art of the highest antiquity in India, as may be seen in the early memorials of Buddhism. Borrowing an impulse from Greek exemplars, the Buddhist sculptors at the commencement of our era freed themselves from the Oriental tradition which demands only the gigantic and the grotesque, and imitated nature with some success. But with the revival of Bráhmanism Hindu sculpture again degenerated; and so far as the art can still be said to exist, it possesses a religious rather than an æsthetic interest. In the cities of Guzerat, and in other parts of India where the houses are built of wood, their fronts are ornamented with elaborate carving. Wood-carving, an important industry in Western India, is said, perhaps erroneously, to owe its origin to Dutch patronage, though the models of the carvers are evidently taken from their own temples. The favourite materials are blackwood, sandal-wood, and jack-wood. The supply of sandal-wood comes from the forests of the Western Gháts in Kánara and Mysore, but some of the finest carving is done at Surat and Ahmadábád. Akin to sandal-wood carving is the inlaying of the miscellaneous articles known as "Bombay boxes." This art is known to be of modern date, having been introduced from Shiraz in Persia towards the close of the last century. It consists of binding together in geometrical patterns strips of tin-wire, sandal-wood, ebony, ivory, and stag's horn. At Vizagapatam, in Madras, similar articles are made of ivory and stag's horn, with scroll-work edged in to suit European taste. At Máinpuri, in the North-Western Provinces, wooden boxes are inlaid with brass wire. The chief seats of ivory-carving are Amritsar, Benares, Murshidábád, and Travancore, where any article can be obtained to order, from a full-sized palanquin to a lady's comb. Human figures in clay, dressed to the life, are principally made at Krishnagar in Bengal, Lucknow, and Poona.

Cotton mills.

It remains to give some account of those manufactures proper, conducted by steam machinery and under European supervision, which have rapidly sprung up in certain parts of India during the past few years. These comprise cotton, jute, silk, and beer.

The first mill for the manufacture of cotton yarn and cloth by machinery worked by steam was opened at Bombay in 1854. The enterprise grew with scarcely a check, until by 1879 the total number of mills throughout India was 58, with about 1½ million spindles and 12,000 looms, giving employment to upwards of 40,000 persons—men, women, and children. Of this total, 30 mills, or more than half, were in the island of Bombay, which now possesses a busy manufacturing quarter with tall chimney stalks, recalling the aspect of a Lancashire town; 14 were in the cotton-growing districts of Guzerat, also in the Bombay presidency; 6 were in Calcutta and its neighbourhood; 3 at Madras; 2 at Cawnpur in the North-Western Provinces; 1 at Nágpur in the Central Provinces; 1 at Indore, the capital of Holkar's dominions; and 1 at Hyderabad, the residence of the nizám. Like the jute mills of Bengal, the cotton factories of Bombay have suffered of late years from the general depression of trade.

The Indian mills are, almost without exception, the property of joint-stock companies, the shares in which are largely taken up by natives. The overlookers are skilled artisans brought from England, but natives are now beginning to qualify themselves for the post. The operatives are all paid by the piece; and, as compared with other Indian industries, the rate of wages is high. In 1877, at Bombay, boys earned from 14s. to £1 a month; women, from 16s. to £1; and jobbers, from £3 to £6, 10s. Several members of one family often work together, earning among them as much as £10 a month. The hours of work are from six in the morning to six at night, with an hour allowed in the middle of the day for meals and smoking. A Factory Act, to regulate the hours of work for children and young persons and to enforce the fencing of dangerous machinery, &c., is now (1881) under the consideration of the legislative council.

Besides supplying the local demand, these mills are gradually beginning to find a market in foreign countries, especially for their twist and yarn. Between 1872-73 and 1878-79 the export of twist from Bombay increased from 1,802,863 lb, valued at £97,162, to 21,271,059 lb, valued at £883,665, or an increase of nearly twelvefold in quantity and ninefold in value. Within the same period of eight years the export of grey piece-goods increased from 4,780,834 yards, valued at £75,495, to 14,993,336 yards, valued at £198,380. The twist and yarn are mostly sent to China and Japan, the piece-goods to the coast of Arabia and Africa. The figures for the coasting trade also show a corresponding growth, the total value of twist carried from port to port in 1878-79 having been £804,996, and of piece-goods (including hand-loom goods) £654,553. Mr O'Conor, who has devoted much attention to the matter, thus summarizes his opinion regarding the future of the Indian cotton mills in his *Review of Indian Trade for* 1877-78:—"Whether we can hope to secure an export trade or not, it is certain that there is a sufficient outlet in India itself for the manufactures of twice fifty mills; and, if the industry is only judiciously managed, the manufactures of our mills must inevitably, in course of time, supersede Manchester goods of the coarser kinds in the Indian market."

Jute mills.

The jute mills of Bengal have sprung up to rival Dundee, just as Bombay competes with Manchester; but in the former case the capital is mostly supplied by Europeans. They cluster thickly round Calcutta, extending across the river into Hooghly district; and one has been planted at Sirájganj, far away up the Brahmaputra in the middle of the jute-producing country. In 1879 the total number of jute mills in India was 21, of which all but two were in Bengal, and the number is annually increasing. The weaving of jute into gunny cloth is an indigenous industry throughout northern Bengal, chiefly in the district of Purniah and Dinájpur. The gunny is made by the semi-aboriginal tribe of Koch, Rájbansí or Páli, both for clothing and for bags; and, as with other industries practised by non-Hindu races, the weavers are the women of the family, and not a distinct caste. In 1877-78 just three million bags were imported into Calcutta from Pábná district, being the product of the Sirájganj mills. The total exports by sea and land of both power-loom and hand-made bags numbered 80 millions, of which not more than 6 millions were hand-made. The East Indian Railway took 20 millions for the grain marts of Behar and the North-Western Provinces (chiefly Patná and Cawnpur); and 1 million went as far as Ludhiána in the Punjab. The total exports by sea exceeded 57 millions, of which 32 millions represent interportal, and 25 millions foreign trade. Bombay took as many as 16 millions, and British Burmah 12 millions. In fact, Calcutta supplies bagging for the whole of India. The foreign trade may be given in greater detail, for gunny weaving is perhaps the single Indian industry that aims at a foreign market. The total export of jute manufactures (both bags and cloth) in 1872–73 was valued at £200,669. By 1878–79 the value had risen to £1,098,434, or an increase of fivefold in six years. Within the same period the exports to the United Kingdom alone increased from 21,200 bags, valued at £585, to 7 million bags, valued at £184,400. The other countries which take Indian gunny bags are the following, with the values for 1877–78:—Australia, £298,186; Straits Settlements, £161,772; United States, £79,795; Egypt, £76,726; China, £32,121.

Brewing. Brewing has recently become established as a prosperous business at the large hill stations on the Himálayas. There are now about twelve breweries in India, including five in the Punjab and North-Western Provinces, at Mari (Murree), Simla, Kasauli, Masuri (Mussoorie), and Náini Tál, and two in the Madras presidency, at Utakamand and Bellary. The total quantity of beer brewed was returned at 2,162,888 gallons in 1877 and 1,522,769 gallons in 1878, the diminution being due to the termination of a contract between the Commissariat Department and one of the Masuri breweries. The total quantity of beer imported in 1878–79 was 2 million gallons by Government and 1 million gallons on private account, so that the Indian breweries now satisfy just one-third of the entire demand. At Simla imported beer sells at over 18s. per dozen, while that from the local brewery can be obtained for 11s. per dozen. The hops are entirely imported, for the experimental plantation of 100 acres established by the rájá of Kashmír has not yet proved a practical success. The imports of hops show a steady increase from 1529 cwts. in 1875–76 to 1807 cwts. in 1876–77, and 2135 cwts. in 1877–78.

Paper. The steam paper-mills established in the neighbourhood of Calcutta and at Bombay have almost entirely destroyed the local manufactures of paper which once existed in many parts of the country. The hand-made article, which was strong though coarse, and formed a Mahometan specialty, is now no longer used for official purposes. Besides manufacturing munitions of war, the

Leather. Government possesses a large leather factory at Cawnpur, which turns out saddlery, &c., of excellent quality. Indeed, leather manufactures are an important local industry in Oudh and the North-Western Provinces, and are conducted on such a scale as to preclude the import from England, except in the case of *articles de luxe*.

Minerals.

The Indian peninsula, with its wide area and diversified features, supplies a great store of mineral wealth, characterized both by variety and unusual richness. In utilizing this wealth, English enterprise has met with many rebuffs. Much capital has been expended with no other result in many cases than disappointment. But the experience has not been thrown away; and the mining industry, now established on a sure basis, is rising into an important position in a country which ought gladly to welcome any employment other than the universal pursuit of agriculture.

Iron. *Iron.*—In purity of ore, and in antiquity of working, the iron deposits of India probably rank first in the world. They are to be found in every part of the country, from the northern mountains of Assam and Kumáun to the extreme south of the Madras presidency. Wherever there are hills, iron is found and worked to a greater or less extent. The indigenous methods of smelting the ore, which are everywhere the same, and have been handed down unchanged through countless generations, yield a metal of the finest quality in a form well suited to native wants. But they require an extravagant supply of charcoal; and even with the cheapness of native labour the product cannot compete in price with imported iron from England. European enterprise, attracted by the richness of the ore and the low rate of wages, has repeatedly tried to establish ironworks on a large scale; but hitherto every one of these attempts has ended in failure, alike in Madras, in the Central Provinces, in the Ráníganj coal-field, and in Kumáun. At the present time iron is manufactured only by peasant families of smelters, each working on a very small scale; and even this industry is languishing under the competition of English imports. The initial difficulty in India is to find the three elements of iron working—namely, the ore, the flux, and the fuel—sufficiently near to each other; the second difficulty is the choking of the furnaces from the excessive quantity of ash in the coal.

Coal. Coal has been known to exist in India since 1774, and is said to have been worked as far back as 1775. There are now altogether fifty-eight collieries in the country, with an annual out-turn of about 1 million tons. In India, as elsewhere, coal-mining and railway extension have gone hand in hand. Coal is comparatively worthless unless it can be brought to market by rail; and the price of coal is the chief element in determining the expenses of railway working. The history of coal in India has, on the whole, been one of continual progress. The first mine, at Ráníganj, dates from 1820, and has been worked regularly up to the present time. In 1878 its output was 50,000 tons. For twenty years no new mine was opened; but the commencement of the East India Railway in 1854 gave a fresh impetus to the industry, and since that date collieries have been opened at the rate of two or three every year. The largest number of additions was seven, in 1874. By 1878 the total number of collieries in connexion with the East Indian system was fifty-six. From these are supplied, not only the railway itself, but also the jute mills of Calcutta, and the river steamers of Lower Bengal. In 1877–78 the railway used 308,000 tons of coal from its own collieries at Karharbárí and Srirámpur, and sent exactly the same quantity to Calcutta. In that year the imports of coal into Calcutta by sea were only 80,000 tons, so that Calcutta now uses about 80 per cent. of Indian to 20 per cent. of foreign coal. Bombay, on the other hand, and also Madras are entirely supplied with coal from England. The collieries in the Central Provinces, which are the only others worked on a large scale, are limited to the supply of the Great Indian Peninsula Railway. They are two in number,—(1) the Warora colliery, under the management of the Public Works Department, and (2) the Mohpání colliery, which has been leased to the Narbadá Coal Company. The total area of the Ráníganj coal-field has been estimated at 500 square miles. In this "black country" of India, which is dotted with tall chimney-stalks, six European companies are at work, besides many native firms. At first coal was raised from surface quarries, but regular mining is now carried on, according to the system of "pillar and stall." The seams are entirely free from gas, so that the precautions usual in England against explosion are found unnecessary. The miners are all drawn from the aboriginal low-castes, chiefly Santáls and Baurís, who are noted for their endurance and docility. Baurís work with the pick, but Santáls will consent to use no other tool than the crowbar. Wages are high, and the men look well-fed, though they waste their surplus earnings in drink. The great drawback of Indian coal is its large proportion of ash, varying from 14 to 20 per cent., as against 3 to 6 per cent. in English coal. This places it at a great disadvantage alike for iron-smelting and locomotive purposes. But it has been proved that, with efficient fire-grates and proper manipulation, 135 lb of Warora coal will do the work of 100 lb of English coal.

Salt. Salt, an article of supreme necessity to the Indian peasant who eats no meat, is derived from three main sources, exclusive of importation from Europe:—(1) by evaporation from sea-water along the entire double line of seaboard from Bombay to Orissa, but especially in Guzerat and on the Coromandel coast; (2) by evaporation from inland lakes, of which the Sámbhar Lake in Rájputána affords the chief example; (3) by quarrying solid hills of salt in the north-east of the Punjab. The last is the only case in which salt can be said to exist as a mineral. It occurs in solid cliffs, which for extent and purity are stated to have no rival elsewhere in the world. The chief of these has given its name to the Salt Range, running across the districts of Jhelum (Jhílam) and Shábpur, from the bank of the Jhelum river to Kálábágh in Bannu district. Similar deposits are found beyond the Indus in Kohát district, where the salt is of two kinds, red and green, and in the hill state of Mandi bordering on Kángrá district. The salt is found in the red marls and sandstones of the Devonian group. In some cases it can be obtained from open quarries; but more generally it is approached by regular mining by pick and blasting, through wide galleries. The principal mine is at Keora in Jhelum district, now called after Lord Mayo. The total annual out-turn in the Punjab is returned at about 50,000 tons, yielding a revenue to Government of more than £400,000. In 1877–78 the actual figures of revenue were—(1) from the Salt Range, £426,000, (2) from Kohat, £8000, (3) from Mandi, £6000.

Rock-salt.

In southern India salt made by evaporation is almost universally consumed. Lower Bengal, especially eastern Bengal, uses salt imported from Cheshire at low rates of freight, and paying the excise duty at Calcutta or other port of entry. In Orissa and south-western Bengal both imported salt and salt made by solar evaporation are consumed, the latter being alone considered pure for religious purposes or for the priests.

Saltpetre.

Saltpetre.—At one time India had almost a monopoly of the supply of saltpetre upon which Europe depended for its gunpowder. In combination with other saline substances it occurs as a white efflorescence upon the surface of the soil in many parts of the country, especially in the upper valley of the Ganges. Its preparation leaves common salt as one of the residuary products; and consequently fiscal reasons have tended to limit the manufacture to the most remunerative region, which is found in North Behar. The manufacture is simple, and entirely in the hands of a special caste of natives, called Nuniyás, who are conspicuous for their capacity of enduring hard work. As is the case with most Indian industries, they work under a system of money advances from middle-men, who are themselves sub-contractors under the large houses of business. In former times the East India Company engaged in the manufacture on its own account; when it abandoned all private trade, its works were taken over by European firms, but these have in their turn retired from the business, which is now in a state of decline, partly owing to the general fall in price, and partly to the restrictions imposed by the salt preventive department. The exports of saltpetre from Calcutta are fairly constant, averaging about 450,000 cwts. a year, of which one-half goes to the United Kingdom. More than two-thirds of the total comes from Behar, chiefly from the districts of Tirhút, Sáran, and Champáran, though Patná is the railway station for despatch to Calcutta. Cawnpur, Gházípur, Allahábád, and Benares, in the North-Western Provinces, send small quantities, while a little comes from the Punjab.

Gold.

Gold exists in many parts and probably in considerable quantities. Herodotus affirms that the Indians were the only nation who paid their tribute to Darius in gold; and there is some reason for believing that the "Ophir" of King Solomon is to be identified with the Malabar coast. Nearly every hill stream is washed for gold, whether in the extreme south, in the central plateau, or on the north-east and north-west frontiers. It is true that gold-washing is everywhere a miserable business, affording the barest livelihood; but yet the total amount of gold obtained in this way cannot be insignificant. In recent years attention has been prominently drawn to the possibility of extracting gold from the quartz formation of southern India, which bears many points of resemblance to the auriferous quartz reefs of Australia. The principal localities are in the Wainád (Wynaad) subdivision of the Nílgiri district and in Kolár district of Mysore. Gold-washing has always been practised there; and the remains of old workings show that at some unknown period operations have been conducted on a large scale.

From about 1875 to 1880 individual pioneers were prospecting in that region. Crushing the quartz by rude native methods, they proved that it contained a larger proportion of gold than is known to yield a profit in Australia. These experiments on the southern ends of six reefs yielded an average of 7 dwts. per ton of quartz, rising in one case to 11 dwts. The best assay of the gold showed a fineness of slightly over 20 carats. In 1879 Government summoned a practical mining engineer from Australia, whose report was eminently hopeful. He described the quartz reefs as of great extent and thickness and highly auriferous. One reef in Kolár, laid bare 100 feet longitudinally, gave an average of 1 oz. of gold per ton. In order to attract capital, Government proposed to grant mining leases at a dead rent of Rs. 5 (10s.) per acre, subject to no royalty or further tax. Up to 1880 the enterprise had scarcely passed beyond the stage of laboratory experiments. If the results of actual working with elaborate machinery realize the promise held out by competent investigators, gold-mining will be established as an important industry in southern India.

Copper.

Copper is known to exist in many parts of the country in considerable quantities. The richest mines are in the lower ranges of the Himálayas, from Dárjíling westward to Kumáun. The ore occurs in the form of copper pyrites, often accompanied by mundic, not in true lodes, but disseminated through the slate and schist. The miners are almost always Nepálís, and the remoteness of the situation has deterred European capital. The extent of abandoned workings proves that these mines have been known and worked for many years. The best seams show a proportion of copper slightly above the average of Cornish ore, but the ordinary yield is not more than about 4 per cent. The mines resemble magnified rabbit-holes, meandering passages being excavated through the rock with little system. The tools used are an iron hammer and chisel, and sometimes a small pick. After extraction, the ore is pounded, washed, and smelted on the spot. The price obtained for the metal is Rs. 2.8.0 per 3 *sers*, or at the rate of about 10d. a pound. Copper-ore, of fair purity and extending over a considerable area, also occurs in Singbhúm district of Chutiá Nágpur, where there are many deserted diggings and heaps of scoriæ. In 1857 a company was started to re-open the workings at these mines; but, though large quantities of ore were produced, the enterprise did not prove remunerative, and was finally abandoned in 1864. A similar attempt to work the copper found in Nellore district of Madras also ended in failure.

Lead.

Lead occurs in the form of sulphuret or galena along the Himálayas on the Punjab frontier, and has been worked at one place by an English company.

Tin.

Tin is confined to the Burmese peninsula. Very rich deposits, yielding about 70 per cent. of metal, occur over a large extent of country in Mergui and Tavoy districts of the Tenasserim region. The ore is washed and smelted, usually by Chinese, in a very rough and unscientific way. Recent experiments made by a European firm seem to show that the deposits, though rich and extensive, are not sufficiently deep to repay more elaborate processes.

Antimony.

Antimony, in the form of *surmá*, which is largely used by the natives as a cosmetic, is chiefly derived from the hill states of the Punjab. It is also found in Mysore and Burmah. The minerals of Rájputána, which have not yet been thoroughly ascertained, include an ore of cobalt used for colouring enamel.

Mineral oil.

Petroleum is produced chiefly in Independent Burmah, but it has also been found on British territory in Pegu, in

Assam, and in the Punjab. Near the village of Ye-nang-yaung in Upper Burmah, on the banks of the Irawadi, there are upwards of one hundred pits or wells with a depth of about 250 feet, from which petroleum bubbles up in inexhaustible quantities. The annual yield is estimated at 11,000 tons, of which a considerable quantity is exported. Petroleum wells are also found in the British districts of Akyab, Kyouk-hpyu, and Thayet-myo, which first attracted British capital with most promising results in 1877. In Assam petroleum occurs in the neighbourhood of the coal-fields in the south of Lakhimpur district, and was worked in conjunction with the coal by a European capitalist in 1866. In the Punjab petroleum is worked by the Public Works Department at two spots in Ráwal Pindí district. In 1873–74 the total yield was only 2756 gallons.

Lime-stone. *Stone.*—The commonest and also the most useful stone of India is *kankar*, a nodular form of impure lime, which is found in almost every river valley, and is used universally for metalling the roads. Lime for building is derived from two sources,—(1) from burning limestone and *kankar*, and (2) from the little shells so abundantly found in the marshes. Calcutta derives its chief supply from the quarries of the Khásí hills in Assam, known as "Sylhet lime," and from the Susunia quarries in Bankura district. The Gangetic delta is destitute of stone, nor does the alluvial soil afford good materials for brick-making or pottery. But a European firm has recently established large pottery-works at Ráníganj in Bardwán, which employ about five hundred hands, and carry out contracts for drainage pipes and stoneware. Other stones. The centre of the peninsula and the hill country generally abound in building-stone of excellent quality, which has been used locally from time immemorial. Among the finest stones may be mentioned the pink marble of Rájputána, of which the historical buildings at Agra were constructed, the trap of the Deccan, the sandstone of the Godávari and the Narbadá, and the granite of southern India. Quarries of slate are scattered through the peninsula, and are sometimes worked by European capital. Mica and talc are also quarried to make ornaments. Among the hills of Orissa and Chutiá Nágpur household vessels and ornaments are skilfully carved out of an indurated variety of potstone.

Diamonds. *Precious Stones.*—Despite its legendary wealth, which is really due to the accumulations of ages, India cannot be said to be naturally rich in precious stones. Under the Mahometan rule diamonds were a distinct source of state revenue; and Akbar is said to have received a royalty of £80,000 a year from the mines of Panna. But at the present day the search for them, if carried on anywhere in British territory, is an insignificant occupation. The name of Golconda has passed into literature; but that city, once the Musalmán capital of the Deccan, was rather the home of diamond-cutters than the source of supply. It is believed that the far-famed diamonds of Golconda actually came from the sandstone formation which extends across the south-east borders of the nizám's dominions into the Madras districts of Ganjám and Godávari. A few worthless stones are still found in that region. Sambalpur, on the upper channel of the Mahánadi river in the Central Provinces, is another spot once famous for diamonds. So late as 1818 a stone is said to have been found there weighing 84 grains and valued at £500. The river valleys of Chutiá Nágpur are also known to have yielded a tribute of diamonds to their Mahometan conqueror. At the present day the only place where the search for diamonds is pursued as a regular industry is the native state of Panna (Punnah) in Bundelkhand. The stones are found by digging down through several strata of gravelly soil and washing the earth. Even there, however, the pursuit is understood to be unremunerative, and has failed to attract European capital. About other gems little information is available. Other gems. Turquoises are said to be found near Múltán in the Punjab, though far inferior to the Persian stones. Independent Burmah yields many valuable gems; and some excitement has been caused by the discovery of sapphire mines just across the Siamese frontier. Poor pearl fisheries exist off the coast of Madura district in the extreme south, and in the Gulf of Cambay; but the great majority of Indian pearls come either from Ceylon or from the Persian Gulf. In the year 1700 the Dutch obtained a lease of all the pearl fisheries along the Madura coast, and sublet the right of fishing to native boatmen, of whom seven hundred are said to have taken licences annually at the rate of 60 *écus* per boat. The town of Cambay in Guzerat is celebrated for its carving in carnelian, agate, and onyx. The stones come from the neighbourhood of Ratanpur, in the state of Rájpípla. They are dug up by Bhíl miners, and subjected to a process of burning before being carved. The most valued colour for carnelians is red, but they are also found white and yellow. Lapis lazuli is found in the mountains of the north, and freely used in the decoration of temples and tombs.

FAMINES.

As the agriculture of India is mainly dependent upon the bounty of nature, so is it peculiarly exposed to the vicissitudes of the seasons. In any country where the population is dense and the means of communication backward, the failure of a harvest, whether produced by drought, by flood, by blight, by locusts, or by war, must always cause much distress. Whether that shall develop into famine is merely a matter of degree, depending upon a combination of circumstances—the comparative extent of the failure, the density of the population, and the practicability of imports.

Causes of famine. Drought, or an inadequate supply of rain, is undoubtedly the great cause of wide-spread famine. No individual foresight, no compensating influences, can entirely prevent those recurring periods of continuous drought with which large provinces of India are afflicted. An average rainfall, if irregularly distributed, may affect the harvest to a moderate degree, as also may flood or blight. The total failure of a monsoon may result in a general scarcity, sufficiently severe to arouse the solicitude of Government. But famine proper, or wide-spread starvation, is caused only by a succession of years of drought. The cultivators of India are not dependent upon a single harvest or upon the crops of one year. In the event of a partial failure, they can draw for their food supply either upon their own grain pits or upon the stores of the village merchants. The first sufferers, and those who suffer most in the end, are the class who live by daily wages. But small is the number that can hold out, either in capital or credit, against a second year of insufficient rainfall; and not impossibly a third season may prove adverse. All the great famines in India of which we have record have been caused by drought, and usually by drought repeated over a series of years.

Water supply. This being so, it becomes necessary to inquire into the water supply, which varies extremely in different parts of the country. It can be derived only from three sources—(1) local rainfall, (2) natural inundation, and (3) artificial irrigation from rivers, canals, tanks, or wells. Any of these sources may exist separately or together. In only a few parts of India can the rainfall be entirely trusted, as both sufficient in its amount and regular in its distribution. Those favoured tracts include the whole strip of coast beneath the Western Ghâts, from Bombay to Cape Comorin; and the greater part of the provinces of Assam and Burmah, together with the deltaic districts at the head of the Bay of Bengal. There the annual rainfall rarely, if ever, falls below 100 inches; artificial irrigation and famine are alike unknown. The whole of the rest of the peninsula may be described as liable, more or less, to drought. In Orissa, the scene of one of the most severe famines of recent times, the average rainfall exceeds 60 inches a year; in Sind, which has been exceptionally free from famine under British rule, the average falls to less than 10 inches. The local rainfall, therefore, is not the only element to be considered. Broadly speaking, artificial irrigation has protected, or is now in course of protecting, certain fortunate regions, such as the eastward deltas of the Madras rivers and the upper valley of the Ganges. The rest, and by far the greater portion, of the country is still exposed to famine. Nor is it easy to see any remedy. Meteorological science may teach us to foresee what is coming; but it may be doubted whether it is in our power to do more than alleviate. Lower Bengal and Oudh are watered by natural inundation as much as by the local rainfall; Sind derives its supplies mainly from canals filled by the floods of the Indus; the Punjab and the North-West Provinces are dependent largely upon wells; the Deccan with the entire south is the land of tanks and reservoirs. But in all these cases, when the rainfall has failed over a series of years, the artificial supply must likewise fail after no long interval, so that irrigation becomes a snare rather than a benefit. Water works on a scale adequate to guarantee the whole of India from drought are not only above the possibilities of finance; they are also beyond the reach of engineering skill.

[Fa]mine [of 18]76-78. Taking the example of the famine of 1876-78, the most wide spread and the most prolonged that India has yet known, we may say that the drought commenced in Mysore by the failure of the monsoon in 1875, and that all fear of distress in the North-West Provinces did not pass away until 1879. But it will always be known in history as the great famine in the south. Over the entire Deccan, from Poona to Bangalore, the south-west monsoon failed to bring its usual rainfall in the summer of 1876. In the autumn of the same year the north-east monsoon proved deficient in the south-eastern districts of the Madras presidency. The main food crop, therefore, entirely perished throughout an immense tract of country; and, as the harvest of the previous year had also been short, prices rapidly rose to famine rates. In November 1876 it was first officially recognized that starvation was abroad in the land, and that Government must adopt measures to keep the people alive. From that time until the middle of 1878, a period of more than eighteen months, the campaign against famine was strenuously conducted, with various vicissitudes. The summer monsoon of 1877 proved a failure; some relief was brought in October of that year by the autumn monsoon; but all anxiety was not removed until the arrival of a normal rainfall in June 1878. Meanwhile the wave of drought had reached northern India, where it found the stocks of grain much depleted to meet the famine demand in the south. Bengal, Assam, and Burmah were the only provinces that escaped scot free in that disastrous year. The North-West Provinces, the Punjab, Rájputána, and the Central Provinces alike suffered from drought through all the summer of 1877, and from its consequences well into the following year. When once famine gets ahead of relief operations, all is over. The flood of distress bursts through the embankment. Starvation and all the attendant train of famine diseases sweep away their thousands. The total expenditure of Government upon famine relief on this occasion may be estimated at about 8 millions sterling, not including the indirect loss of revenue nor the amount debited against the state of Mysore. For this large sum of money there is but little to show in the way of works constructed. The largest number of persons in receipt of relief at one time in Madras was 2,591,900 in September 1877; of these only 634,581 were nominally employed on works, while the rest were gratuitously fed. From cholera alone the deaths were returned at 357,430 for Madras, 58,648 for Mysore, and 57,252 for Bombay. Dr Cornish, the sanitary commissioner of Madras, well illustrated the effects of the famine by contrasting the returns of births and deaths over a series of years. In 1876, when famine with its companion cholera was already beginning to be felt, the births registered in Madras numbered 632,113 and the deaths 680,381. In 1877, the year of famine, the births fell to 477,447, while the deaths rose to 1,556,312. In 1878 the results of the famine showed themselves by a still further reduction of the births to 348,346, and by the still high number of 810,921 deaths. In 1879 the births recovered to 476,307, still considerably below the average, and the deaths diminished to 548,158. These figures are, of course, not accurate; but they serve to show how long the results of famine are to be traced in the vital statistics of a people.[1]

Previous famines. The first great famine of which we have any trustworthy record is that which devastated the lower valley of the Ganges in 1769-70. One-third of the population is credibly reported to have perished. The previous season had been bad; and, as not uncommonly happens, the break-up of the drought was accompanied by disastrous floods. Beyond the importation into Calcutta and Murshidábád of a few thousand *maunds* of rice from the fortunate districts of Bákarganj and Chittagong, it does not appear that any public measures for relief were taken or proposed. The next great famine was that which afflicted the Carnatic from 1780 to 1783, and has been immortalized by the genius of Burke. It was primarily caused by the ravages of Hyder Ali's army. A public subscription was organized by the Madras Government, from which sprang the "Monegar Choultry," or permanent institution for the relief of the native poor. In 1783-84 Hindustan Proper suffered from a prolonged drought, which stopped short at the frontier of British territory. Warren Hastings, then governor-general, advocated the construction of enormous granaries, to be opened only in times of necessity. One of these granaries or *golás* stands to the present day in the city of Patná, but it was never used until the scarcity of 1874. In 1790-92 Madras was again the scene of a two years' famine, which is memorable as being the first occasion on which the starving people were employed by Government on relief works. No useful lesson of administrative experience is to be learned from the long list of famines and scarcities which afflicted the several provinces of India at recurring periods during the first half of the present century. In 1860-61 a serious attempt was made to alleviate an exceptional distress in the North-Western Provinces. About half a million persons are estimated to have been relieved at an expenditure by Government of about three quarters of a million sterling. Again, in 1865-66, which will ever be known as the year of the Orissa famine, the Government attempted to organize relief works and distribute charitable funds. But on neither of these occasions can it be said that the efforts were successful. In Orissa, especially, the admitted loss of one-fourth of

[1] With regard to the deaths caused by the famine and the diseases connected with it, the Famine Commissioners thus report:—"It has been estimated, and in our opinion on substantial grounds, that the mortality which occurred in the provinces under British administration during the period of famine and drought extending over the years 1877 and 1878 amounted, on a population of 197 millions, to 5¼ millions in excess of the deaths that would have occurred had the seasons been ordinarily healthy; and the statistical returns have made certain what has long been suspected, that starvation and distress greatly check the fecundity of the population. It is probable that from this cause the number of births during the same period has been lessened by 2 millions; the total reduction of the population would thus amount to about 7 millions. Assuming the ordinary death roll, taken at the rate of 35 per *mille*, on 190 millions of people, the abnormal mortality of the famine period may be regarded as having increased this total by about 40 per cent." But when estimated over a period of years the effect of famine as a check upon the population is small. The Famine Commissioners calculate that, taking the famines of the past thirty years, as to which alone an estimate of any value can be made, the abnormal deaths caused by famine and its diseases have been less than 2 per *mille* of the Indian population per annum. As a matter of fact cultivation quickly extended after the famine of 1877-78, and there were in Bombay and Madras 120,000 more acres under tillage after the long protracted scarcity than before it.

the population proves the danger to which an isolated province is exposed. The people of Orissa died because they had no surplus stocks of grain of their own, and because importation was absolutely impracticable. Passing over the prolonged drought of 1868-70 in the North-West Provinces and Rájputána, we come to the Behar scarcity of 1873-74, which first attracted the interest of England. Warned by the failure of the rains, and watched and stimulated by the excited sympathy of the public at home, the Government carried out in time a comprehensive scheme of relief. By the expenditure of 6½ millions sterling, and the importation of one million tons of rice, all risk even of the loss of life was prevented. The comparatively small area of distress, and the facilities of communication by rail and river, alone permitted the accomplishment of the feat, which remains unparalleled in the annals of famine. During the recent famine in southern India the authorities worked with no less energy, and charitable bounty was far more conspicuous, yet the conditions of the case predestined failure. The stricken tract was many times larger than Behar. No early warning was given. The rainfall failed, not once, but for three successive seasons, and, above all, adequate importation and distribution of grain were physical impossibilities. The people were dying while the grain that could have kept them alive was rotting on the beach of Madras or on the railway sidings of Upper India. What administrative enterprise can accomplish where the circumstances are within the compass of human control may be learned from the case of Bombay. In that presidency the famine affected about 34,000 square miles of country, with a population of about 5,000,000 souls. The highest number of persons in receipt of relief at one time was 529,000 in June 1877, of whom the great majority were employed on remunerative works. The importation of grain was left entirely free; and within twelve months 268,000 tons were brought by rail and 166,000 tons by sea into the distressed districts. The total gross cost to Government was estimated at 1½ millions, of which about 1 million will be returned.

ADMINISTRATION.

The supreme authority over all British India, both for executive and legislative purposes, is vested by a series of Acts of Parliament [1] in the viceroy or governor-general-in-council, subject to the ultimate sanction of the secretary of state in England. Every executive order and every legislative statute runs in the name of the "Governor-General-in-Council"; [2] but in certain exceptional classes of cases [3] a power is reserved to the viceroy to act independently of his council. This council is twofold. First, there is the ordinary or executive council, [4] usually composed of about six official members besides the viceroy, which may be compared with the cabinet of a constitutional country. It meets regularly at short intervals, discusses and decides upon questions of foreign policy and domestic administration, and prepares measures for the legislative council. Its members divide among themselves the chief departments of state, such as those of foreign affairs, finance, war, public works, &c.; while the viceroy combines in his own person the duties both of constitutional sovereign and prime minister. Secondly, there is the legislative council, [5] which is constituted by the same members as the preceding, with the addition of the governor of the province in which it may be held, and official delegates from Madras and Bombay, together with certain nominated members representing the non-official native and European communities. The meetings of the legislative council are held when and

Executive council.

Legislative council.

[1] The chief of these Acts are 13 Geo. III. c. 63; 33 Geo. III. c. 52; 3 and 4 Will. IV. c. 85; 21 and 22 Vict. c. 106; and 24 and 25 Vict. c. 67.

[2] A style first authorized by 33 Geo. III. c. 52, § 39.

[3] "Cases of high importance and essentially affecting the public interest and welfare" (33 Geo. III. c. 52, § 47); "when any measure is proposed whereby the safety, tranquillity, or interests of the British possessions in India may in the judgment of the governor-general be essentially affected" (3 and 4 Will. IV. c. 85, § 49); "cases of emergency" (24 and 25 Vict. c. 67, § 23).

[4] The lineal descendant of the original council organized under the charters of the Company, first constituted by parliamentary sanction in 1773 (13 Geo. III. c. 63, § 7).

[5] Originally identical with the executive council, upon which legislative powers were conferred by 13 Geo. III. c. 63, § 36. The distinction between the two councils was first recognized in the appointment of "the fourth member" (3 and 4 Will. IV. c. 85, § 40).

as required. They are open to the public; and a further guarantee for publicity is insured by the proviso that draft bills must be published a certain number of times in the *Gazette*. As a matter of practice, these draft bills have usually been first subjected to the criticism of the several provincial governments. In regard to the supreme judicial authority there is no such uniform system. The presidencies of Madras and Bombay, and also two of the three great provinces which have been created out of the old presidency of Bengal, and are now known as the lieutenant-governorships of Bengal and the North-Western Provinces, have each a high court, [6] supreme both in civil and criminal business, with an ultimate appeal to the judicial committee of the privy council in England. Of the subordinate provinces, the Punjab has a chief court, with three judges; the Central Provinces, Oudh, Mysore, and Berar have each a judicial commissioner, who sits alone; while in Assam and British Burmah the chief commissioner, or supreme executive officer, is also the highest judicial authority.

The law administered in the Indian courts consists mainly of (1) the enactments of the Indian legislative councils above described and of the bodies which preceded them, (2) statutes of the British parliament which apply to India, (3) the Hindu and Mahometan laws on domestic inheritance or other cases affecting the Hindus and Mahometans, and (4) the customary law affecting particular castes and races. Much has been done towards consolidating individual sections of the Indian law; and in the Indian penal code, together with the codes of civil and criminal procedure, we have memorable examples of such efforts.

But, though the governor-general-in-council is theoretically supreme over every part of India alike, [7] his actual authority is not everywhere exercised in the same direct manner. For ordinary purposes of administration British India is partitioned into provinces, each with a government of its own; and certain of the native states are attached to those provinces with which they are most nearly connected geographically. These provinces, again, enjoy various degrees of independence, in accordance with the course of their historical development. The two sister presidencies of Madras and Bombay still retain many marks of their original equality with Bengal. They each have an army and a civil service of their own. They are each administered by a governor appointed direct from England, with an executive and a legislative council, whose functions are analogous to those of the councils of the governor-general. [8] They thus possess a domestic legislature; and in administrative matters, also, the interference of the viceroy is a somewhat remote contingency. Of the other provinces, Bengal, or rather Lower Bengal, occupies a peculiar position. Like the North-Western Provinces and the Punjab, it is administered by a single official, with the style of lieutenant-governor, who is controlled by no executive council; but, unlike those two provinces, Bengal has a legislative council, so far preserving a sign of its early pre-eminence. The remaining provinces, whether ruled by a lieutenant-governor or by a chief commissioner, may be regarded from an historical point of view as fragments of the original Bengal presidency, which as thus defined would be co-extensive with all British India that is not appropriated either to Madras or to Bombay. The lieutenant-governors and most of the chief commissioners are chosen from the covenanted civil service. In executive matters they are the practical rulers; but, excepting the lieutenant-governor of Bengal, they have no legislative authority. To com-

[6] First constituted out of the Supreme Courts and the Sudder (Sadr) Courts in 1861 (24 and 25 Vict. c. 104).

[7] 3 and 4 Will. IV. c. 85, §§ 39 and 65.

[8] 24 and 25 Vict. c. 67, § 42.

plete the total area of territory under British administration, it is necessary to add certain *quasi*-provinces, under the immediate control of the viceroy. These consist of Ajmír (Ajmere), transferred from Rájputána; Berar, or the districts assigned by the nizám of Hyderabad; the state of Mysore, to be restored in 1881 upon terms to its native rájá; and the tiny territory of Coorg, in the extreme south.

Another difference of administration, though now of less importance than in former times, derives its name from the old regulations, or uniform rules of law and practice which preceded the present system of acts of the legislature. These regulations, originally intended to be universal in their application, have been from time to time withdrawn so far as regards certain tracts of country which from their backward state of civilization or other causes seemed to require exceptional treatment. In non-regulation territory, broadly speaking, a larger measure of discretion is allowed to the officials, both in the collection of revenue and in the administration of civil justice; strict rules of procedure yield to the necessities of the case, and the judicial and executive departments are to a great extent combined in the same hands. Closely connected with this indulgence in favour of the personal element in administration, a wider field is also permitted for the selection of the administrative staff, which is not confined to the covenanted civil service, but includes military officers on the staff and also uncovenanted civilians. The title of the highest authority in a non-regulation district is not that of collector-magistrate, but deputy commissioner; and the supreme authority in a non-regulation province is usually styled, not lieutenant-governor, but chief commissioner. The Central Provinces and British Burmah are examples of non-regulation provinces; but non-regulation districts are to be found also in Bengal and the North-Western Provinces, where their existence can always be traced by the office of deputy commissioner

Non-regulation territory.

Alike in regulation and in non-regulation territory the unit of administration is the district,—a word of very definite meaning in official phraseology. The district officer, whether known as collector-magistrate or as deputy commissioner, is the sole responsible head of his jurisdiction

Upon his energy and character rests ultimately the efficiency of the Indian Government. Not only are his own special duties so numerous and so vast as to be bewildering to the outsider, but the work of his subordinates, European and native, largely depends upon the stimulus of his personal example. His position has been compared to that of the French *préfet*; but such a comparison is unjust in many ways to the Indian district officer: he is not a creature of the Home Office, who takes his colour from his chief and represents only officialism, but an active worker in every department of popular well-being, with a large measure of individual initiative. As the very name of collector-magistrate implies, his main functions are twofold. He is a fiscal officer, charged with the collection of the revenue from land and other sources; and he is a civil and criminal judge of first instance. But this explanation of his title by no means exhausts his multifarious duties. He does in his local sphere all that the home secretary is supposed to do in England, and a great deal more; for he is the representative of a paternal and not of a constitutional government. Police, jails, education, municipalities, roads, sanitation, dispensaries, are all to him matters of daily concern; while, in addition, he is expected to make himself acquainted with every phase of the social life of the natives and with each natural aspect of the country. Besides being a lawyer, an accountant, and a clerk, he ought also to possess no mean knowledge of agriculture, political economy, and engineering.

Districts and sub-districts.

The total number of districts in British India is two hundred and thirty-eight. They vary greatly in size and in number of inhabitants. The average area is 3778 square miles, ranging from an average of 6612 square miles in Madras to an average of 1999 square miles in Oudh. The average population is 802,927, similarly ranging from an average of 1,508,219 in Madras to an average of 161,597 in Burmah. The Madras districts are thus both the largest and the most populous. In every province but Madras, the districts are grouped into larger areas, known as divisions, each under the charge of a commissioner. But these divisions are not properly units of administration, as the districts are. They are aggregates of units, formed only for convenience of supervision, so that an intermediate authority may exercise the universal watchfulness which would be impossible for a distant lieutenant-governor. The districts are again partitioned out into lesser tracts, which are strictly units of administration, though subordinate ones. The system of partitioning, and also the nomenclature, vary in the different provinces; but generally it may be said that the subdivision or *tahsíl* is the ultimate unit of administration. The double name indicates the twofold principle of separation: the subdivision is properly the charge of an assistant magistrate or executive officer, the *tahsíl* is the charge of a deputy-collector or fiscal officer; and these two offices may or may not be in the same hands. Broadly speaking, the subdivision is characteristic of Bengal, where revenue duties are in the background, and the *tahsíl* of Madras, where the land settlement requires attention year by year. There is no administrative unit below the subdivision or *tahsíl*. The *thána*, or police division, only exists for police purposes. The *parganá*, or fiscal division under native rule, has now but an historical interest. The village still remains as the agricultural unit, and preserves its independence for revenue purposes in certain parts of the country. The township is peculiar to Burmah.

The judicial jurisdictions coincide for the most part with the magisterial and fiscal boundaries. But, except in Madras, where the districts are large, a single civil and sessions judge, *i.e.*, the supreme judicial officer under the high court, sometimes exercises jurisdiction over more than one district. As has been already mentioned, in non-regulation territory judicial and executive functions are combined in the same hands.

The preceding sketch of Indian administration would be incomplete without a reference to the secretariat, or central office, which in some sense controls and gives life to the whole. From the secretariat are issued the orders which regulate or modify the details of administration; into the secretariat come all the multifarious reports from the local officers, to be there digested for future reference. But though the secretaries may enjoy the advantages of life at the presidency capitals, with higher salaries and better prospects of promotion, it is recognized that the efficiency of the empire rests ultimately upon the shoulders of the district officers, who bear the burden and heat of the day, with few opportunities of winning fame or reward.

Land settlement.

Land Settlement.—As the land furnishes the main source of Indian revenue, so the assessment of the land tax is the main work of Indian administration. No technical term is more familiar to Anglo-Indians, and none more strange to the English public, than that of land settlement. No subject has given rise to more voluminous controversy. It will be enough in this place to explain the general principles upon which the system is based, and to indicate the chief differences of application in the several provinces. That the state should appropriate to itself a direct share in the produce of the soil is a fundamental maxim of Indian finance, that has been recognized throughout the East from time immemorial. The germs of rival systems can be traced in the old military and other service tenures of Assam, and in the poll tax of Burmah, &c. The exclusive development of the land system is due to two conditions,—a comparatively high state of agriculture and an organized plan of administration,—both of which are supplied by the primitive village community. During the lapse of untold generations, despite domestic anarchy and foreign conquest, the Hindu village has in many parts preserved its simple customs, written in the imperishable tablets of tradition. The land was not held by private owners, but by occupiers under the petty corporation; the revenue was not due from individuals, but from the community represented by its head-man. The aggregate harvest of the village fields was thrown into a common fund, and before the general distribution the head-man was bound to set aside the share of the state. No other system of taxation could be theoretically more just, or in practice less obnoxious to the people. Such is an outline of the land system as it may be found at the present day throughout large portions of India both under British and native rule; and such we may fancy it to have been universally before the Mahometan conquest. The Musalmáns brought with them the avarice of conquerors, and a stringent system of revenue collection. Under the Mughal empire, as organized by Akbar the Great, the share of the state was fixed at one-third of the gross produce of the soil; and a regular army of tax-collectors was permitted to intervene between the cultivator and the supreme government. The entire vocabulary of the present land system is borrowed from the Mughal administration. The *zamíndár* himself is a creation of the Mahometans, unknown to the early Hindu system. He was originally a mere tax-collector, or farmer of the land revenue, who agreed to furnish a lump sum from the tract of country assigned to him. If the Hindu village system may be praised for its justice, the Mughal farming system had at least the merit of efficiency. Sháh Jáhán and Aurangzeb extracted a larger land revenue than the British do. When the government was first undertaken by the East India Company, no attempt was made to understand the social system upon which the land revenue was based. The *zamíndár* was conspicuous and useful; the village community and the cultivating *ráyat* did not force themselves into notice. The *zamíndár* seemed a solvent person, capable of keeping a contract; and his official position as tax-collector was confused with the proprietary rights of an English landlord. The superior stability of the village system was overlooked, and in the old provinces of Bengal and Madras the village organization has gradually been suffered to fall into decay. The consistent aim of the British authorities has been to establish private property in the soil, so far as is consistent with the punctual payment of the revenue. The annual Government demand, like the succession duty in England, is universally the first liability on the land; when that is satisfied, the registered landholder has powers of sale or mortgage scarcely more restricted than those of a tenant in fee-simple. At the same time the possible hardships, as regards the cultivator, of this absolute right of property vested in the owner have been anticipated by the recognition of occupancy rights or fixity of tenure, under certain conditions. Legal rights are everywhere taking the place of unwritten customs. Land, which was before merely a source of livelihood to the cultivator and of revenue to the state, has now become the subject of commercial speculation. The fixing of the revenue demand has conferred upon the owner a credit which he never before possessed, by allowing him a certain share of the unearned increment. This credit he may use improvidently, but none the less has the land system of India been raised from a lower to a higher stage of civilization.

The means by which the land revenue is assessed is known as settlement, and the assessor is styled a settlement officer. In Bengal the assessment has been accomplished once and for all, but throughout the greater part of India the process is continually going on. The details vary in the different provinces; but, broadly speaking, a settlement may be described as the ascertainment of the agricultural capacity of the land. Prior to the settlement is the work of survey, which first determines the area of every village and frequently of every field also. Then comes the settlement officer, whose duty it is to estimate the character of the soil, the kind of crop, the opportunities for irrigation, the means of communication and their probable development in the future, and all other circumstances which tend to affect the value of the produce. With these facts before him, he proceeds to assess the Government demand upon the land according to certain general principles, which may vary in the several provinces. The final result is a settlement report, which records, as in a Domesday Book, the entire mass of agricultural statistics concerning the district.

Lower Bengal and a few adjoining districts of the North-Western Provinces and of Madras have a permanent settlement, *i.e.*, the land revenue has been fixed in perpetuity. When the Company obtained the *díwání* or financial administration of Bengal in 1765, the theory of a settlement, as described above, was unknown. The existing Mahometan system was adopted in its entirety. Engagements, sometimes yearly, sometimes for a term of years, were entered into with the *zamíndárs* to pay a lump sum for the area over which they exercised control. If the offer of the *zamíndár* was not deemed satisfactory, another contractor was substituted in his place. But no steps were taken, and perhaps no steps were possible, to ascertain in detail the amount which the country could afford to pay. For more than twenty years these temporary engagements continued, and received the sanction of Warren Hastings, the first titular governor-general of India. Hastings's great rival, Francis, was among those who urged the superior advantages of a permanent assessment. At last, in 1789, a more accurate investigation into the agricultural resources of Bengal was commenced, and the settlement based upon this investigation was declared perpetual by Lord Cornwallis in 1793. The *zamíndárs* of that time were raised to the status of landlords, with rights of transfer and inheritance, subject always to the payment in perpetuity of a rent-charge. In default of due payment, their lands were liable to be sold to the highest bidder. The aggregate assessment was fixed at *sikká* Rs. 26,800,989, equivalent to Co.'s Rs. 28,587,722, or say $2\frac{3}{4}$ millions sterling. By the year 1871–72 the total land revenue realized from the same area had increased to Rs. 35,208,866, chiefly owing to the inclusion of estates which had escaped the original assessment for various reasons. While the claim of Government against the *zamíndárs* was thus fixed for ever, it was intended that the rights of the *zamíndárs* over their own tenants should be equally restricted. But no detailed record of tenant-right was inserted in the settlement papers, and, as a matter of fact, the cultivators lost rather than gained in security of tenure. The same English prejudice which made a landlord of the *zamíndár* could recognize nothing but a tenant-at-will in the *ráyat*. By two stringent regulations of 1799 and 1812 the tenant was practically put at the mercy of a rack-renting landlord. If he failed to pay his rent, however excessive, his property was rendered liable to distraint and his person to imprisonment. At the same time the operation of the revenue sale law had introduced a new race of *zamíndárs*, who were bound to their tenants by no traditions of hereditary sympathy, but whose sole object was to make a profit out of their newly purchased property. The rack-rented peasantry found no protection in the law courts until 1859, when an Act was passed which restricted the landlord's powers of enhancement in certain specified cases. The *zamíndár* is the only person recognized by the revenue law; but in a large number of cases the *zamíndár* has in effect parted with all his interest in the land by means of the creation of perpetual leases or *patnis*. These leases are usually granted in consideration of a premium or lump sum paid down, and there is nothing to prevent the *patnidár* from creating an indefinite series of sub-tenures beneath his own. The permanent settlement was not preceded by any systematic survey. But in the course of the past thirty years the whole of Bengal has been subject to a professional survey, which determined the boundaries of every village, and issued maps on the scale of 4 inches to the mile.

La
lav
of

This survey, however, has only a topographical value. No statistical inquiries were made, and no record obtained of rights in the soil. Even the village landmarks then set up have fallen into decay.

The permanent settlement was confined to the three provinces of Bengal, Behar, and Orissa, according to their boundaries at that time. Orissa Proper, which was conquered from the Marhattás in 1803, is subject to a temporary settlement, of which the current term of thirty years will not expire until 1897. The assessment is identical with that fixed in 1838, which was based upon a careful field measurement and upon an investigation into the rights of every landholder and under-tenant. The settlement, however, was made with the landholder, and not with the tenant, and in practice the rights of the cultivators are no more secure than in Bengal. In Assam Proper, or the valley of the Brahmaputra, the system of settlement is simple and effective. The cultivated area is artificially divided into *mauzás* or blocks, over each of which is placed a native official or *mauzádár*. Every year the *mauzádár* ascertains the area actually under cultivation, and then assesses the fields according to their character, at a certain prescribed rate.

.yat- .ri tle- .nt.

The prevailing system throughout the Madras presidency is the *ráyatwárí*, which takes the cultivator or peasant proprietor as its rent-paying unit, somewhat as the Bengal system takes the *zamíndár*. This system cannot be called indigenous to the country, any more than the *zamíndárí* of Bengal. If any system deserves that name, it is that of village assessment, which still lingers in the memories of the people in the south. When the British declared themselves heir to the nawáb of the Carnatic at the opening of the present century, they had no adequate experience of revenue management. The authorities in England favoured the *zamíndárí* system already at work in Bengal, which appeared at least calculated to secure punctual payment. The Madras Government was accordingly instructed to enter into permanent engagements with *zamíndárs*, and, where no *zamíndárs* could be found, to create substitutes out of enterprising contractors. The attempt resulted in failure in every case, except where the *zamíndárs* happened to be the representatives of ancient lines of powerful chiefs. Several of such chiefs exist in the extreme south and in the north of the presidency. Their estates have been guaranteed to them on payment of a *peshkash* or permanent tribute, and are saved by the custom of primogeniture from the usual fate of subdivision. Throughout the rest of Madras there are no *zamíndárs* either in name or fact. The influence of Sir Thomas Munro afterwards led to the adoption of the *ráyatwárí* system, which will always be associated with his name. According to this system, an assessment is made with the cultivating proprietor upon the land taken up for cultivation year by year. Neither *zamíndár* nor village officer intervenes between the cultivator and the state, which takes directly upon its own shoulders all a landlord's responsibility. The early *ráyatwárí* settlements in Madras were based upon insufficient experience. They were preceded by no survey, but adopted the crude estimates of native officials. Since 1858 a department of revenue survey has been organized, and the old assessments have been everywhere revised.

Nothing can be more complete in theory and more difficult of exposition, than a Madras *ráyatwárí* settlement. First, the entire area of the district, whether cultivated or uncultivated, and of each field within the district is accurately measured. The next step is to calculate the estimated produce of each field, having regard to every kind of both natural and artificial advantage. Lastly, a rate is fixed upon every field, which may be regarded as roughly equal to one-third of the gross and one-half of the net produce. The elaborate nature of these inquiries and calculations may be inferred from the fact that as many as thirty-five different rates are sometimes struck for a single district, ranging from 6d. to £1, 4s. per acre. The rates thus ascertained are fixed for a term of thirty years; but during that period the aggregate rent-roll of a district is liable to be affected by several considerations. New land may be taken up for cultivation, or old land may be abandoned; and occasional remissions are permitted under no less than eighteen specified heads. Such matters are discussed and decided by the collector at the *jamabandi* or court held every year for definitely ascertaining the amount of revenue to be paid by each *ráyat* for the current season. This annual inquiry has sometimes been mistaken by careless passers-by for an annual reassessment of each *ráyat's* holding. It is not, however, a change in the rates for the land which he already holds, but an inquiry into and record of the changes in his former holding or of any new land which he may wish to take up.

In the early days of British rule no system whatever prevailed throughout the Bombay presidency; and even at the present time there are tracts where something of the old confusion survives. The modern "survey tenure," as it is called, dates from 1838, when it was first introduced into one of the *tálukas* of Poona district, and it has since been gradually extended over the greater part of the presidency. As its name implies, the settlement is preceded by survey. Each field is measured, and an assessment placed upon it according to the quality of the soil and the crop. This assessment holds good, without any possibility of modification, for a term of thirty years. The average rate varies from a maximum of 4s. 6d. an acre in the rich black soil lands of Guzerat to a minimum of 10d. an acre in the barren hills of the Concan.

The primary characteristic of the Bombay system is its simplicity. The field is the unit, and its actual occupier is the only person recognized by the revenue law. He knows exactly what he will have to pay, and the state knows what it will receive, during the currency of the term. The assessment is, in fact, a rent-charge liable to be modified at intervals of thirty years. Secondly, the system is characterized by its fairness to the tenant. He possesses "a transferable and heritable property, continuable without question at the expiration of a settlement lease, on his consenting to the revised rate." To borrow a metaphor from English law, his position has been raised from that of a villein to that of a copyholder. In exchange for the mere leave to exist and till the soil he has received a right of property in the soil he tills, and he stands forth a free man. If the Bombay peasants have not reaped all the advantages from this system that might have been hoped for, the fault rests, not with the system, but with themselves. They were unequal to the responsibilities of property which they had not won by their own exertions, but which the state (perhaps prematurely) cast upon them.

The North-Western Provinces and the Punjab have a similar land system. In that part of India the village community has preserved its integrity more completely than elsewhere. Government therefore recognizes the village, and not the *zamíndár's* estate or the *ráyat's* field, as the unit of land administration. Throughout the North Western Provinces, indeed, the village is commonly owned by proprietors with the title of *zamíndár*, whereas in the Punjab the community is still the proprietor. But this is a distinction of tenure rather than of administration. In both cases alike the state recognizes only the village, and makes its arrangement with the owners of the village, whether they be one or many, whether they be individuals, a corporation, or a *bháyáchára* (brotherhood). The survey there becomes a more comprehensive undertaking than in Madras or Bombay. In addition to measurement, and agricultural appraisement and calculation, it includes the duty of drawing up an exhaustive record of all rights and sub-tenures existing in every village. The proprietors are alone responsible for the revenue; but, when the state limits its claims against them, it is no less careful to define at the same time the rights of other parties interested in the soil. The term of settlement both in the North-Western Provinces and in the Punjab is thirty years. The principle of assessment is that the Government revenue shall be equal to one-half of the improved rent, leaving the other half as the share of the landlord, who is liable for due payment, and has the trouble of collecting it from the cultivators. The average rate of assessment is about 2s. 11d. per acre in the North-Western Provinces, and 1s. 4d. in the Punjab.

The Oudh *tálukdárs* resemble English landlords even more closely than do the *zamíndárs* of Bengal. In origin the majority were not revenue-farmers, but territorial magnates, whose influence was derived from feudal authority as much as from mere wealth. Their present legal status dates from the pacification that followed on the mutiny of 1857. The engagement then entered into has been described as a political treaty rather than a revenue assessment. The great *tálukdárs* were invited to become responsible each for a gross sum payable from the territory over which he exercised feudal rights. This sum was fixed in perpetuity; and the exceptional position of the *tálukdárs* was recognized by conferring upon them, not only the right of succession by primogeniture, but also the privilege of bequest,—a privilege unknown alike to Hindu and Mahometan law. Land not comprised in *tálukdárí* estates was settled in the ordinary way with its proprietors or *zamíndárs* for a term of thirty years. The whole of Oudh has since been accurately surveyed.

The Central Provinces contain many varieties of land tenure, from the feudatories, who pay only a light tribute, to the village communities, who are assessed in the usual manner after survey. Population is sparse and agriculture backward, so that the incidence of land revenue is everywhere low. The survey was conducted generally on the Punjab system, adopting the village and not the field as the unit of measurement. The current settlement for a term of thirty years will expire in 1897.

Land revenue.

In 1873–74 the total land revenue realized from territory under British administration in India amounted to £20,919,256, which is raised to £22,768,144 by the inclusion of certain local rates and cesses levied on land. This latter figure shows an average of 9·4d. per acre of gross area and 2s. 4·7d. per head of total population. The highest rate of assessment appears to be that in Bombay, which is 3s. 10·4d. per head; the lowest, 1s. 2·7d. per head in Bengal and Assam.

Salt administration.

Salt Administration.—Next to land, salt contributes the largest share to the Indian revenue; and, where salt is locally manufactured, its supervision becomes an important part of administrative duty. Up to within quite recent times the tax levied upon salt varied extremely in different parts of the country, and a strong preventive staff was required to be stationed along a continuous barrier hedge, which almost cut the peninsula into two fiscal sections. The reform of Sir J. Strachey in 1878, by which the higher rates were reduced and the lower rates raised, with a view to their ultimate equalization over the whole country, effectually abolished this old engine of oppression. Communication is now free; and it has been found that prices are absolutely lowered by thus bringing the consumer nearer to his market, even though the rate of taxation be increased. In the Punjab and Rájputána salt administration has thus become, as in Lower Bengal, a simple matter of weighing quantities and levying a uniform tax. In Bombay, also, the manufacture is now conducted with a minimum of expense at large central depôts in Guzerat under a thorough system of excise supervision. Along the western coast, however, from Orissa to Cape Comorin, the process of evaporating sea-water is everywhere carried on as a private industry, though on Government account. As with poppy cultivation in Bengal, the manufacture of salt is a monopoly, which can only be defended by the peculiar circumstances of the case. No one is compelled to manufacture, and rights of property in a salt-pan are strictly respected, while the state contrives, by means of a careful staff of supervisors, to obtain the maximum of profit with a minimum of interference. The system as at present carried on has been gradually developed out of the experience of nearly a century. The manufacturers belong to the same class as ordinary cultivators; and, as a rule, their condition is somewhat more prosperous, for they possess an hereditary privilege with a commercial value. They do not work upon a system of advances, as is the case with so many other Indian industries; but they are paid at a certain rate when they bring their salt to the Government depôt. This rate of payment, known as *kudivaram*, is at present fixed at an average of 1 *ánná* 5·8 *pies* per *maund* of $82\frac{2}{7}$ lb; the other expenses of the salt department, for supervision, &c., raise the total cost to 3 *ánnás* 5·6 *pies* per *maund*. The price now charged to the consumer by the Madras Government is Rs. 2.8.0 per *maund*, the balance being net profit. The equal rate of salt duty which will ultimately prevail throughout all India is Rs. 2.8.0 per *maund*, or 7s. a cwt. This rate is already (1881) levied in Madras, Bombay, the North-Western Provinces, and the Punjab, but in Bengal a higher rate is provisionally in force of Rs. 2.14.0 per *maund*, or 8s. a cwt. In British Burmah only 3 *ánnás* per *maund*, or 6d. a cwt., is charged for local consumption, and a transit duty of 1 per cent. *ad valorem* for salt sent across the frontier.

Excise.—Excise, like salt, is not only a department of revenue collection, but also to a great extent a branch of the executive. In other words, excise duties in India are not a mere tax upon the consumer, levied for convenience through the manufacturer and retail dealer, but a species of Government monopoly. The only excisable articles are intoxicants and drugs; and the avowed object of the state is to check consumption not less than to raise revenue. Details vary in the different provinces, but the general plan of administration is the same. The right to manufacture and the right to retail are both monopolies of Government permitted to private individuals only upon terms. Distillation of country spirits is allowed according to two systems,—either to the highest bidder under strict supervision, or only upon certain spots set apart for the purpose. The latter is known as the *sadr* or central distillery system. The right of sale is also usually farmed out to the highest bidder, subject to regulations fixing the minimum quantity of liquor that may be sold at one time. The brewing of beer from rice and other grains, which is universal among the hill tribes and other aboriginal races, is practically untaxed and unrestrained. The European breweries recently established at several hill stations pay a tax at the rate of 6d. a gallon. Apart from spirits, excise duties are levied upon the sale of a number of intoxicating or stimulant drugs, of which the most important are opium and *gánjá* or *bhang*. Opium is issued for local consumption in India from the Government manufactories at Patná and Benares, and sold through private retailers at a monopoly price. This drug is chiefly consumed in Assam, Burmah, and the Punjab. *Gánjá* is an intoxicating preparation made from the flowers and leaves of Indian hemp (*Cannabis sativa*, var. *indica*). The cultivation of hemp for this purpose is almost confined to a limited area in Rájsháhí district, Bengal, and to the farther valleys of the Himálayas, whence the drug is imported under the name of *charas*. Its abuse is sometimes a cause, not only of crime, but also of insanity. Government attempts to check consumption—first, by fixing the retail duty at the highest rate that will not encourage smuggling, and, secondly, by continually raising that rate as experience allows. Scientifically speaking, *gánjá* consists of the flowering and fruiting heads of the female plant; *bhang* or *siddhi*, of the dried leaves and small stalks, with a few fruits; while *charas* is the resin itself, collected in various ways as it naturally exudes. No duty whatever is now levied upon tobacco in any part of India. The plant is universally grown by the cultivators for their own smoking, and, like everything else, was subject to taxation under native rule; but the impossibility of accurate excise supervision has caused the British Government to abandon the impost.

Municipals.

The municipalities at present existing in India are a creation of the legislature and a branch of the general system of administration. Their origin is to be traced, not in the native *pancháyat*, but in the necessity for relieving the district officer of some of the details of his work. The *pancháyat* or elective council of five is one of the institutions most deeply rooted in the Hindu mind. By it the village community was governed, the head-man being only the executive official, not the legislator or judge; by it all caste disputes were settled; by it traders and merchants were organized into powerful guilds, to the rules of which even European outsiders have had to submit; by it the Síkh army of the *khálsá* was despotically governed, when the centralized system of Ranjít Sinh fell to pieces at his death. But the Hindu village organization had been greatly broken up under Mughal rule. The modern municipal committee is a body appointed by Government, on the nomination of the collector, to assist him in the discharge of his local duties, and to assess new modes of taxation. Police, roads, and sanitation are the three main objects for which a municipality is constituted. Outside a municipality these objects are (in different provinces) the care of the collector, of some member of his subordinate staff, or of a local fund board. Within municipal limits they are delegated to a committee, who practically derive their authority from the collector's sanction, implied or expressed. Except in the great towns, the municipalities cannot be said to enjoy any of the attributes of corporate life. However, as education advances, and with it the desire and capacity of self-government, the municipal committee will doubtless form the germ from which free local institutions will in the future be developed. In 1876-77, excluding the three presidency capitals, there were altogether 894 municipalities in British India, with 12,381,059 inhabitants, or just 7 per cent. of the total population. Out of an aggregate number of 7519 members of municipal committees concerning whom information is available, 1794 were Europeans and 5725 natives; 1863 were *ex-officio*, 4512 nominated, and 1144 elected,—the last class being almost confined to the North-Western and Central Provinces. The financial statistics of these municipalities are given in a subsequent section.

Finance.

Imperial Finance.—It is impossible to present a concise view of Indian finance, such as shall be at once accurate and intelligible. In the first place, the aggregate figures of revenue and expenditure are officially returned according to a system which, though necessary for purposes of account, usually misleads the English financier. The whole system of administration is based upon the view that the British power is a paternal despotism, which owns, in a certain sense, the entire soil of the country, and whose duty it is to perform the various functions of a wealthy and enlightened proprietor. In addition, it takes on itself the business of a manufacturer and trader on a grand scale, as in the case of opium and salt. All these considerations tend to swell the totals on both sides of the balance-sheet with large items, which, on strict analysis, ought to be eliminated as mere matters of account. The actual taxation on the people of British India for 1878, as will be shown below, was 34⅞ millions, or under 3s. 8d. per head of the population. In the second place, the methods of keeping the public accounts have been subjected to frequent changes during recent years, to such an extent as to render comparative statements of totals valueless.

The following table, which has been compiled from the *Parliamentary Abstract for* 1877-78, exhibits the gross imperial revenue and expenditure of India for that year, according to the system of accounts adopted at the time. For the reasons already given, it is practically impossible to analyse these statements in such a way as to show the actual amount raised by taxation, and the actual amount returned in protection to person and property. It is equally impossible to compare the totals with those for previous years. The only profitable plan is to take some of the items and explain their real meaning.

Gross Revenue.

Land revenue	£20,026,036
Tributes and contributions	675,120

Miscellaneous	2,619,872
Total	£62,512,388

Revenue.

Revenue.—It will be seen from the above statement that the larger portion of the gross revenue is not derived from taxation at all. Public works, including railways, alone yield about 7½ millions sterling, or nearly 13 per cent. of the total. If we add the items of post office and telegraphs, which also represent payment for work done or services supplied, the proportion rises to nearly 14 per cent. Then the sum of 9 millions gross, or 6½ millions net, derived from opium, being somewhat more than an additional 15 per cent. of the gross revenue, is admitted to be no charge upon the native tax-payer, but a voluntary contribution to the Indian exchequer by the Chinese consumer of the drug. Nearly one-third of the total gross revenue is thus accounted for. The land revenue, amounting to just 20 millions in an exceptionally bad year, cannot be passed over so lightly. Whether it should be properly regarded as a tax, or only as rent, is an abstruse problem for political economists to settle; but, in any case, it is paid without question, as an immemorial perquisite of the state. It yields 34 per cent., or more than one-third of the gross revenue. The importance of the land tax from the point of view of administration has been considered in a previous section. Setting aside provincial rates and assessed taxes as insignificant in their amount and variable in their incidence, we are left with four principal headings,—excise, customs, salt, and stamps,—which together constitute the indisputable taxation of the people. The total amount yielded by these four items is just 14½ millions, being nearly 25 per cent., or one-fourth of the whole. Salt alone yields 6½ millions, or 11 per cent. On the total population of 191 millions, the gross revenue of 59 millions shows an incidence of 6s. 2⅛d. per head. The land tax alone shows an incidence of 2s. 1⅛d. per head, the four taxes proper of 1s. 6¼d. per head. The whole revenue of British India of the nature of actual taxation, including land revenue, excise, assessed taxes, provincial rates, customs, salt, and stamps, amounted in 1878 to £34,883,586, or 3s. 7⅝d. per head. The rate was about 4s. per head in 1880.

Of the four items, excise and stamps are both almost entirely creations of British rule. Excise is simply a tax upon intoxicating liquors and deleterious drugs, levied both on the manufacture and on the sale, according to different systems in different provinces. Like the corresponding duty in England, it is voluntarily incurred, and presses hardest upon the lowest classes. But, unlike the English excise, it can hardly be called an elastic source of revenue, for the rate is intentionally kept so high as to discourage consumption. No duty whatever is levied upon tobacco. Stamps, as in England, is an ambiguous item. The greater part is derived from fees on litigation, and only a comparatively trifling amount from stamps proper on deeds of transfer, &c. Customs are divided into import and export duties, both of which have been so greatly lightened in recent years that their permanent maintenance must be considered doubtful. At the present time (1881) import duties, usually at the rate of 5 per cent. *ad valorem*, are levied upon a comparatively long list of commodities, of which the chief are cotton goods above a certain degree of fineness. All duties on exports have now been removed, with the single exception of that on rice, which brings in about £500,000 a year. That is levied at the rate of 3 *ánnás* a *maund*, or about 6d. per cwt., being equivalent to an *ad valorem* rate of about 10 per cent. India, including Burmah, possesses a practical monopoly of the supply of rice to Europe, and therefore the tax falls upon the consumer rather than upon the native producer. The salt tax is a matter of more importance and of greater difficulty. As an impost upon an article of prime necessity, and as falling with greatest severity upon the lowest classes, it violates the elementary rules of political economy. On the other hand, it may be urged that this tax is familiar to the people, and levied in a manner which arouses no discontent, and that it is the only means available of spreading taxation proper over the community. Recent reforms have tended to equalize the incidence of the salt tax over the entire country, with the immediate result of abolishing arbitrary and vexatious customs lines, and with a view to its ultimate reduction.

Expenditure.

Expenditure.—Putting aside the cost of collection and civil administration, which explain themselves, the most important items of expenditure are army, interest on debt, famine relief, loss by exchange, and public works, to which may be added the complex item of payments in England. Military expenditure averages fully 16 millions a year, being thus considerably more than the whole amount obtained from taxation proper. Of this total, about 12 millions represent payments in India, and 4 millions payments in England. On non-effective services nearly 2 millions are expended in England and less than £700,000 in India. Regimental pay accounts for nearly 7 millions, the commissariat for about 2 millions in India, and stores for another million in England. In 1877-78 the total capital of the Indian debt was returned at over 146½ millions sterling, being just 15s. 4d. per head of the population. The total charge for interest was 5 millions, being at the rate of £3, 14s. 4d. per cent.; but this excludes the interest to be credited against expenditure on reproductive public works, which is entered under another heading. In 1840 the debt amounted to only 30 millions, but it gradually increased to 52 millions in 1857. Then came the Mutiny, which added 42 millions of debt in four years. The rate of increase was again gradual but slow till about 1874, when famine relief conspired with public works to cause a rapid augmentation, which has continued to the present time. The most significant feature in that augmentation is the larger proportion of debt contracted in England. During the last ten years the silver debt has risen only 10 millions, whereas the gold debt has risen 28 millions. No charge has recently pressed harder upon the Indian exchequer than that of famine relief. Apart from loss by reduced revenue, the two famines of 1874 and 1877-78 have caused a direct expenditure on charitable and relief works, amounting in the aggregate to nearly 15 millions. Loss by exchange is an item which has only lately taken its place in the accounts, and is due to the circumstance that large payments in gold require to be made in England by means of the depreciated rupee. It is, of course, not a matter of expenditure proper, but merely the result of a peculiar mode of book-keeping, which estimates the rupee at the arbitrary value of 2s. In 1869-70 the loss by exchange was more than balanced by an equally nominal entry of gain by exchange on the other side of the ledger. In 1876-77 this item attained its maximum of nearly $1\frac{3}{4}$ million net. The expenditure on public works is provided from three sources—(1) the capital of private companies, with a Government guarantee, (2) loans for the construction of railways and canals, (3) current revenue applied towards such works as are considered to be not directly remunerative. In 1877-78 the total capital raised by the guaranteed railway companies was $95\frac{1}{2}$ millions, and the net earnings were 5 millions, thus showing on the average a satisfactory balance-sheet. In the ten years ending with 1878 29 millions were expended under the second head upon works classed as reproductive or extraordinary, of which 19 millions were appropriated to state railways and 10 millions to irrigation. The amount spent from revenue upon ordinary public works in 1877-78 was nearly $3\frac{3}{4}$ millions. The division of the expenditure into that paid in India and that paid in England becomes of importance when it is remembered that the latter portion requires to be provided in gold. In 1877-78, out of the total expenditure of $62\frac{1}{2}$ millions, $48\frac{1}{2}$ millions, or 78 per cent., were paid in India, and 14 millions, or 22 per cent., in England, including the guaranteed interest of the railway.companies.

Local Finance.—Independent of imperial finance, and likewise independent of certain sums annually transferred from the imperial exchequer to be expended by the provincial governments, there is another Indian budget for local revenue and expenditure. That consists of an income derived mainly from cesses upon land, and expended to a great extent upon minor public works. In 1877-78 local revenue and expenditure were each returned at about $3\frac{1}{2}$ millions.

Municipal Finance.—Yet a third budget is that belonging to the municipalities. The three presidency towns of Calcutta, Madras, and Bombay had in 1876-77 a total municipal income of £668,400, of which £519,322 was derived from taxation, being at the rate of 7s. per head of population. In addition, there were 894 minor municipalities, with a total population of 12,381,059. Their aggregate income was £1,246,974, of which £979,088 was derived from taxation, being at the rate of 1s. 7d. per head. In the presidency towns, rates upon houses, &c., are the chief source of income; but in the district municipalities, excepting Bengal, octroi duties are more relied upon. On the side of expenditure the chief items are conservancy, roads, and police.

Army.—At the present time (1881) the entire constitution of the Indian army is under the consideration of a commission. The existing organization is based upon the historical division into the three presidencies of Bengal, Madras and Bombay There are still three Indian armies, each composed of both European and native troops, with their own commanders-in-chief and separate staff, though the commander-in-chief in Bengal exercises a supreme authority over the other two. There is also a fourth army, known as the Punjab frontier force, which, though on the Bengal establishment, is under the immediate orders of the lieutenant-governor of the province.

Police. *Police.*—Excluding the village watch, which is still maintained as a subsidiary force in many parts of the country, the total regular police of all kinds in British India in 1877 consisted of a total strength of 157,999 officers and men, being an average of one policeman to every $7\frac{1}{4}$ square miles of total area or to every 1096 of the total population. The total cost of maintenance was £2,511,704, of which £2,165,073 was payable from imperial or provincial revenues. The former figure gives an average cost of £3 per square mile of area and 3d. per head of population. The average pay of each constable was 7 rupees a month, or £8, 8s. a year.

Jails. *Jails.*—In 1877 the total number of places of confinement in British India, including central and district jails and lock-ups, was 636; the total number of prisoners admitted during the year, or remaining over from the previous year, was 587,288; the daily average was 118,456—113,087 males and 5369 females. These figures show 1 male prisoner to every 868 of the male population, 1 female prisoner to every 17,244 of the female population, and 1 prisoner to every 1618 of the total population of both sexes. The places of transportation for all British India are the Andaman and Nicobar Islands, where there are two penal establishments; these contained in 1877 a daily average of 9145 convicts.

EDUCATION.

The existing system of education in India is mainly dependent upon the Government, being directly organized by the state, at least in its higher departments, assisted throughout by grants-in-aid, and under careful inspection. But at no period of its history has India been an altogether unenlightened country. The origin of the Deva-Nágari alphabet is lost in antiquity, though that is generally admitted not to be of indigenous invention. Inscriptions on stone and copper, the palm-leaf records of the temples, and in later days the wide-spread manufacture of paper, all alike indicate, not only the general knowledge, but also the common use, of the art of writing. From the earliest times the caste of Bráhmans has preserved, by oral tradition as well as in MSS., a literature unrivalled alike in its antiquity and in the intellectual subtlety of its contents. The Mahometan invaders introduced the profession of the historian, which reached a high degree of excellence, even as compared with contemporary Europe. Through all changes of government vernacular instruction in its simplest form has always been given, at least to the children of respectable classes, in every large village. On the one hand, the *tols* or seminaries for teaching Sanskrit philosophy at Benares and Nadiyá recall the schools of Athens and Alexandria; on the other, the importance attached to instruction in accounts reminds us of the picture which Horace has left of a Roman education. Even at the present day knowledge of reading and writing is, owing to the teaching of Buddhist monks, as widely diffused throughout Burmah as it is in some countries of Europe. English efforts to stimulate education have ever been most successful when based upon the existing indigenous institutions.

During the early days of the East India Company's rule the promotion of education was not recognized as a duty of Government. The enlightened mind of Warren Hastings did indeed anticipate his age by founding the Calcutta *madrasa* for Mahometan teaching, and by affording steady patronage alike to Hindu *pandits* and European students. But Wellesley's schemes of imperial dominion did not extend beyond the establishment of a college for English officials. Of the Calcutta colleges, that of Sanskrit was founded in 1824, when Lord Amherst was governor-general, the medical college by Lord William Bentinck in 1835, the Hooghly *madrasa* by a wealthy native gentleman in 1836. The Sanskrit college at Benares had been established in 1791, the Agra college in 1823. Meanwhile the missionaries made the field of vernacular education their own. Discouraged by the official authorities, and ever liable to banishment or deportation, they not only devoted themselves with courage to their special work of evangelization, but were also the first to study the vernacular dialects spoken by the common people. Just as two centuries earlier the Jesuits at Madura, in the

[1] All Officers.

extreme south, composed works in Tamil, which are still acknowledged as classical by native authors, so did the Baptist mission at Serampur, near Calcutta, first raise Bengáli to the rank of a literary dialect. The interest of the missionaries in education, which has never ceased to the present day, though now comparatively overshadowed by Government activity, had two distinct aspects. They studied the vernacular, in order to reach the people by their preaching and to translate the Bible; and they taught English, as the channel of non-sectarian learning.

At last the Government awoke to its own responsibility in the matter of education, after the long and acrimonious controversy between the advocates of English and vernacular teaching had worn itself out. The present system dates from 1854, being based upon a comprehensive despatch sent out by Sir C. Wood (afterwards Lord Halifax) in that year. At that time the three universities were founded at Calcutta, Madras, and Bombay; English-teaching schools were established in every district; the benefit of grants-in-aid was extended to the lower vernacular institutions and to girls' schools; and public instruction was erected into a department of the administration in every province, under a director, with a staff of inspectors. In some respects this scheme may have been in advance of the time; but it supplied a definite outline, which has gradually been filled up with each succeeding year of progress. A network of schools has now been spread over the country, graduated from the indigenous village institutions up to the highest colleges. All alike receive some measure of pecuniary support, which is justified by the guarantee of regular inspection; and a series of scholarships at once stimulates efficiency and opens a path to the university for children of the poor. In 1877–78 the total number of educational institutions of all sorts in British India was 66,202, attended by an aggregate of 1,877,942 pupils, showing an average of one school to every 14 square miles, and nine pupils to every thousand of the population. In the same year the total expenditure upon education from all sources was £1,612,775, of which £782,240 was contributed by the provincial governments, £258,514 was derived from local rates, and £32,008 from municipal grants. These items may be said to represent state aid, while endowments yielded £37,218, subscriptions £105,853, and fees and fines £277,039. The degree in which education has been popularized and private effort has been stimulated may be estimated from the fact that in Bengal the total of voluntary payments now exactly balances the total of Government grants.

Universities.—The three universities of Calcutta, Madras, and Bombay were incorporated in 1857, on the model of the university of London. They are merely examining bodies, composed of a chancellor, vice-chancellor, and senate, with the privilege of conferring degrees in arts, law, medicine, and civil engineering. The governing body, or syndicate, consists of the vice-chancellor and certain members of the senate. Quite recently a fourth university, on the same plan, has been founded at Lahore for the Punjab. Though not themselves places of instruction, the universities control the whole course of higher education by means of their examinations. The entrance examination for matriculation is open to all; but when that is passed candidates for higher stages must enrol themselves in one or other of the affiliated colleges. In the ten years ending 1877–78 9686 candidates successfully passed the entrance examination at Calcutta, 6381 at Madras, and 2610 at Bombay. Many fall off at that stage, and very few proceed to the higher degrees. During the same ten years 952 graduated B.A., and only 254 M.A., with honours, at Calcutta; 496 B.A. and 14 M.A. at Madras; 217 B.A. and 28 M.A. at Bombay. Calcutta possesses by far the majority of graduates in law and medicine, while Bombay is similarly distinguished in engineering. In 1877–78 the total expenditure on the four universities was £22,093.

The colleges or institutions for higher instruction may be divided into two classes,—those which teach the arts course of the universities, and those devoted to special branches of knowledge. According to another principle, they are classified into those entirely supported by Government and those which only receive grants-in-aid. The latter class comprises the missionary colleges. In 1877–78 the total number of colleges, including medical and engineering colleges and Mahometan *madrasas*, was 82, attended by 8894 students. Of these, 35 colleges with 3848 students were in Bengal proper, and 21 colleges with 1448 students in Madras. In the same year the total expenditure on the colleges was £186,162, or at the rate of £21 per student.

Boys' Schools.—This large class includes many varieties, which may be subdivided either according to the character of the instruction given, or according to the proportion of Government aid they receive. The higher schools are those in which not only is English taught, but that language is also the medium of instruction. They educate up to the standard of the entrance examination at the universities, and train generally those candidates who seek employment in the upper grades of Government service. As far as possible one of these schools, known as the *zilá* or district school, is established by Government at the head-quarters of every district, and many others receive grants-in-aid. The middle schools, as their name implies, are intermediate between the higher and the primary schools. Generally speaking, they are placed in the smaller towns and larger villages, and they provide that measure of instruction which is recognized to be useful by the middle classes themselves. Some of them teach English, but others only the vernacular. This class includes the *tahsili* schools, established at the headquarters of every *tahsil* or subdivision in the North-Western Provinces. In 1877–78 the total expenditure on both higher and middle schools was £478,250. The lower and primary schools complete the series. They present every degree of efficiency, from the indigenous and unaided village school to the vernacular schools in the presidency capitals. Their extension is the chief test of the success of the educational system. No uniformity prevails in this matter throughout the several provinces. In Bengal up to the last few years primary instruction was sadly neglected; but, since the reforms inaugurated by Sir G. Campbell in 1872, by which the benefit of the grant-in-aid rules was extended to the *páthsálás* or village schools, this reproach has been removed. In 1871–72 the total number of primary schools under inspection was only 2451, attended by 64,779 pupils. By 1877–78 the number of schools had risen to 16,042, and the number of pupils to 360,322, being an increase of about sixfold in six years. In the latter year the total expenditure from all sources was £78,000, towards which Government contributed only £27,000, thus showing how state aid stimulates private outlay. The North-Western Provinces owe their system of primary instruction to their great lieutenant-governor, Mr Thomason, whose constructive talent can be traced in every department of the administration. In addition to the *tahsili* or middle schools already referred to, he drew up a scheme for establishing *halkabandi* or primary schools in every central village (whence their name), to which the children from the surrounding hamlets might resort. His scheme has since been largely developed by means of the educational cess added to the land revenue. In Bombay the primary schools are mainly supported out of local funds raised in a similar manner. In British Burmah, on the other hand, primary education is still left to a great extent in the hands of Buddhist monks, who receive no pecuniary support from Government. The monastic schools are only open to boys, but there are also lay teachers who admit girls to mixed classes. Government has hardly any schools of its own in Burmah, the deficiency being supplied by several missionary bodies, who obtain state aid. In many parts of the Madras presidency, also, the missionaries possess a practical monopoly of education at the present day. In 1877–78 the amount of money expended upon lower and primary schools in British India was £406,135, or just one-fourth of the total educational budget.

Girls' Schools.—Of late years something has been done, though not much, to extend the advantages of education to girls. In this, as in other educational matters, the missionaries have been the pioneers of progress. In a few exceptional places, such as Tinnevelli in Madras, the Khási hills of Assam, and among the Karen tribes of Burmah, female education has a real existence, for in these places the missionaries have influence enough to overcome the prejudices of the people. But elsewhere, even in the large towns and among the English-speaking classes, all attempts to develop the intelligence of women are regarded with scarcely disguised aversion. Throughout the North-Western Provinces, with their numerous and wealthy cities, and a total female population of 15 millions, only 6550 girls attended school in 1877–78. In Bengal, with just double the inhabitants, the corresponding number was less than 12,000. Madras, British Burmah, and to a small degree Bombay and the Punjab, are the only provinces that contribute to the following statistics in any tolerable proportion:—Total girls' schools in 1877–78, 2002; number of pupils, 66,615; mixed schools for boys and girls, 2955; pupils, 90,915; total amount expended on girls' schools, £78,729, of which £27,000 was devoted to the 12,000 girls of Bengal.

Normal and other Special Schools, &c.—In 1877–78 the normal and technical schools numbered 155, with a total of 6864 students;

the total expenditure was £54,260, or an average of nearly £7 per student. School mistresses, as well as masters, are trained in these institutions; and there also the missionaries have shown themselves active in anticipating a work which Government subsequently took up. Of schools of art, the oldest is that founded by Dr A. Hunter at Madras in 1850, and taken in charge by the Education Department in 1856. This school, as also those at Calcutta and Bombay, has been very successful in developing the industrial capacities of the people, and training workmen for public employment. Museums have been established at the provincial capitals and many other large towns. Schools for European and other foreign races have also attracted the attention of Government. In 1877-78 the number of such institutions was 104, with 9121 pupils; the expenditure from all sources was £80,197, or an average of nearly £9 per pupil. Foremost among these are the asylums for the orphans of British soldiers, established at hill stations (*e.g.* Utakamand and Sanáwar) in memory of Sir Henry Lawrence.

News-papers. *Newspapers and Books.*—Closely connected with the subject of education is the steady growth of the vernacular press, which is ever busy issuing both newspapers and books. The missionaries were the first to cast type in the vernacular languages, and to employ native compositors. The earliest newspaper was the Bengáli *Sámáchar Darpan*, which was issued in 1835 by the Baptist Mission at Serampur. For many years the vernacular press preserved the marks of its origin, by being limited almost absolutely to theological controversy. The missionaries continued their work; and they were encountered with their own weapons by the theistic sect of the Bráhma Samáj, and also by orthodox Hindus. So late as 1850 the majority of newspapers were still sectarian rather than political, but during the last twenty years the vernacular press has gradually risen to become a powerful engine of political discussion. The number of newspapers regularly published in the several vernaculars at the present time is said to reach the formidable total of 230. The aggregate number of copies issued is estimated by Mr Roper Lethbridge at about 150,000; but the circulation proper, that is, the actual number of readers, is infinitely larger. In Bengal the vernacular press suffers from the competition of English newspapers, some of which are entirely owned and written by natives. In the north-west, from Lucknow to Lahore, about 100 newspapers are printed in Hindustáni or Urdu, the vernacular of the Mahometans throughout India. Many of these are conducted with considerable ability and enterprise, and may fairly be described as representative of native opinion in the large towns. The Bombay journals are almost equally divided between Marathí and Guzerathi. Those in the former language are characterized by the traditional independence of the race of Sivají; those in the latter language are the organs of the Pársis and of the trading community. The newspapers of Madras printed in Tamil and Telugu are politically unimportant, being still for the most part devoted to religion.

Books. As regards books, or rather registered publications, in the vernacular languages, Bengal takes the lead; while the Punjab, Bombay, the North-Western Provinces, and Madras follow in order. In 1877-78 the total number of registered publications was 4890, of which 544 were in English, 3064 in one of the vernaculars, 719 in a classical language of India, and 563 bilingual. Of the vernacular works, 709 dealt with religion, 663 with poetry and the drama, 330 with language, 195 with science, 181 with fiction, 146 with law, and 95 with medicine.[1]

History.

Non-Aryan or Aboriginal Races.

Aboriginal tribes. Our earliest glimpses of India disclose two races struggling for the soil. The one was a fair-skinned people, who had lately entered by the north-western passes—a people of Aryan (literally "noble") lineage, speaking a stately language, worshipping friendly and powerful gods. The other was a race of a lower type, who had long dwelt in the land, and whom the lordly new-comers drove back before them into the mountains, or reduced to servitude on the plains. The comparatively pure descendants of these two races in India are now nearly equal in number, there being about 18 millions of each; their mixed progeny, sprung chiefly from the ruder stock, make up the mass of the present Indian population.

The lower tribes were an obscure people, who, in the absence of a race-name of their own, are called the non-Aryans or aborigines. They have left no written records; indeed, the use of letters, or of the simplest hieroglyphics, was to them unknown. The sole works of their hands which have come down to us are the rude stone circles and upright slabs or mounds beneath which, like the primitive peoples of Europe, they buried their dead. From these we only discover that, at some far distant but unfixed period, they knew how to make round pots of hard, thin earthenware, that they fought with iron weapons, and that they wore ornaments of copper and gold. The coins of imperial Rome have been found in their later graves. Earlier remains, lying in the upper soils of large areas, prove that these ancient tomb-builders formed only one link in a chain of primæval races. Long before their advent, India was peopled, as far as the depths of the Central Provinces, by tribes unacquainted with the metals, who hunted and warred with polished flint axes and other deftly-wrought implements of stone similar to those dug up in northern Europe. And even these were the successors of yet ruder beings, who have left their agate knives and rough flint weapons in the Narbadá valley. In front of this far-stretching background of the Bronze and Stone Ages, we see the so-called aborigines being beaten down by the newly arrived Aryan race.

The struggle is commemorated by the two names which the victors gave to the early tribes, namely, the Dasyus, or "enemies," and the Dásas, or "slaves." The last remains to this day the family name of multitudes of the lower class in Bengal. The new-comers from the north prided themselves on their fair complexion, and their Sanskrit word for "colour" (*varna*) came to mean "race" or "caste." Their earliest poets, at least three thousand and perhaps four thousand years ago, praised in the *Rig-Veda* their gods, who, "slaying the Dasyus, protected the *Aryan colour*," who "subjected the black-skin to the Aryan man." Moreover, the Aryan, with his finely-formed features, loathed the squat Mongolian faces of the aborigines. One Vedic singer speaks of them as "noseless" or flat-nosed, while another praises his own "beautiful-nosed" gods. The same unsightly feature was commented on with regard to a non-Aryan Asiatic tribe, by the companions of Alexander the Great on his Indian expedition, at least a thousand years later. The Vedic hymns abound in scornful epithets for the primitive tribes, as "disturbers of sacrifices," "gross feeders on flesh," "raw-eaters," "lawless," "not-sacrificing," "without gods," and "without rites." As time went on, and these rude tribes were driven back into the forest, they were painted in still more hideous shapes, till they became the "monsters" and "demons" of the Aryan poet and priest. Their race-name Dasyu, "enemy," thus grew to signify a goblin or devil, as the old Teutonic word for enemy has become the English "fiend."

Nevertheless, all of them could not have been savages. We hear of wealthy Dasyus, and even the Vedic hymns speak much of their "seven castles" and "ninety forts." In later Sanskrit literature the Aryans make alliance with aboriginal princes; and when history at length dawns on the scene, we find some of the most powerful kingdoms of India ruled by dynasties of non-Aryan descent. Nor were they devoid of religious rites, nor of cravings after a future life. "They adorn," says a very ancient Sanskrit treatise,[2] "the bodies of their dead with gifts, with raiment, with ornaments, imagining that thereby they shall attain the world to come." These ornaments are the bits of bronze, copper, and gold, which we now dig up from beneath their rude stone monuments. In the great Sanskrit epic which narrates the advance of the Aryans into southern India, a non-Aryan chief describes his race as "of fearful swiftness, unyielding in battle, in colour like a dark blue cloud."[3]

[1] In the preparation of the administrative sections and statistics, the writer specially acknowledges the assistance of Mr J. S. Cotton.

[2] Chandogya Upanishad, quoted in Muir's *Sanskrit Texts*.

[3] Rámáyana.

Thrust back by the Aryans from the plains, these primitive peoples have lain hidden away in the recesses of the mountains, like the remains of extinct animals which zoologists find in hill-caves. India thus forms a great museum of races, in which we can study man from his lowest to his highest stages of culture.

Among the rudest fragments of mankind are the isolated Andaman islanders in the Bay of Bengal. The old Arab and European voyagers described them as dog-faced man-eaters. The English officers sent to the islands in 1855 to establish a settlement found themselves surrounded by quite naked cannibals of a ferocious type, who daubed themselves when festive with red earth, and mourned in a suit of olive-coloured mud. They used a noise like weeping to express friendship or joy, bore only names of common gender, which they received before birth; and their sole conception of a god was an evil spirit who spread disease. For five years they repulsed every effort at intercourse by showers of arrows; but the officers slowly brought them to a better frame of mind by building sheds near the settlement, where these poor beings might find shelter from the tropical rains, and receive medicines and food.

The Anamalai hills, in southern Madras, form the refuge of a whole series of broken tribes. Five hamlets of long-haired wild-looking Puliars live on jungle products, mice, or any small animals they can catch, and worship demons. Another clan, the Mundavars, shrink from contact with the outside world, and possess no fixed dwellings, but wander over the innermost hills with their cattle, sheltering themselves under little leaf-sheds, and seldom remaining in one spot more than a year. The thick-lipped small-bodied Kaders, "Lords of the Hills," are a remnant of a higher race. They file the front teeth of the upper jaw as a marriage ceremony, live by the chase, and wield some influence over the ruder forest-folk. These hills, now very thinly peopled, abound in the great stone monuments (kistvaens and dolmens) which the primitive tribes used for their dead. The Nairs of south-western India still practice polyandry, according to which a man's property descends not to his own but to his sister's children. That system also appears among the Himálayan tribes at the opposite extremity of India.

In the Central Provinces the aboriginal races form a large proportion of the population. In certain districts, as in the feudatory state of Bastár, they amount to three-fifths of the inhabitants. The most important race, the Gonds, have made some advances in civilization; but the wilder tribes still cling to the forest, and live by the chase, and some of them are reported to have used, within a few years back, flint points for their arrows. The Máriás wield bows of great strength, which they hold with their feet while they draw the string with both hands. A still wilder tribe, the Máris, fly from their grass-built huts on the approach of a stranger. Once a year a messenger comes to them from the local rájá to take their tribute of jungle products. He does not enter their hamlets, but beats a drum outside, and then hides himself. The shy Máris creep forth, place what they have to give in an appointed spot, and run back again into their retreats.

Further to the north-east, in the tributary states of Orissa, there is a poor tribe, 10,000 in number, of Juangs or Patuas, literally the "leaf-wearers," whose women formerly wore no clothes. Their only vestige of covering was a few strings of beads round the waist with a bunch of leaves tied before and behind. Those under the British influence were clothed in 1871 by order of Government, and their native chief was persuaded to do the same work for the others. This leaf-wearing tribe had no knowledge of the metals till quite lately, when foreigners came among them, and no word exists in their native language for iron or any other metal. But their country abounds with flint weapons, so that the Juangs form a remnant to our own day of the Stone Age. "Their huts," writes the officer who knows them best, "are among the smallest that human beings ever deliberately constructed as dwellings. They measure about 6 feet by 8. The head of the family and all the females huddle together in this one shell, not much larger than a dog-kennel." The boys and the young men of the village live in one large building apart by themselves; and this custom of having a common abode for the whole male youth of the hamlet is found among many of the aboriginal tribes in distant parts of India. The Kandhs of Orissa, who kept up their old tribal ritual of human sacrifice until it was put down by the British in 1835–45, and the Santáls in the west of Lower Bengal, who rose in 1855, are examples of powerful and highly developed non-Aryan tribes.

Proceeding to the northern boundary of India, we find the slopes and spurs of the Himálayas peopled by a great variety of rude tribes. As a rule they are fierce, black, undersized, and ill-fed. They formerly eked out a wretched subsistence by plundering the more civilized hamlets of the Assam valley,—a means of livelihood which they are but slowly giving up under British rule. Some of the wildest of them, such as the independent Abars, are now employed as a sort of irregular police, to keep the peace of the border, in return for a yearly gift of cloth, hoes, and grain. Their very names bear witness to their former wild life. One tribe, the Akas of Assam, is divided into two clans, known respectively as "The eaters of a thousand hearths," and "The thieves who lurk in the cotton-field."

Whence came these primitive peoples, whom the Aryan invaders found in the land more than three thousand years ago, and who are still scattered over India, the fragments of a prehistoric world? Written records they do not possess. Their oral traditions tell us little, but such hints as they yield feebly point to the north. They seem to preserve dim memories of a time when the tribes dwelt under the shadow of mightier hill ranges than any to be found on the south of the river plains of Bengal. "The Great Mountain" is the race-god of the Santáls, and an object of worship among other tribes. The Gonds, in the heart of of Central India, have a legend that they were created at the foot of Dewálagiri Peak in the Himálayas. Till lately they buried their dead with the feet turned northwards, so as to be ready to start again for their ancient home in the north.

Non-Aryan languages.

The language of the non-Aryan races, that record of a nation's past more enduring than rock inscriptions or tables of brass, is being slowly made to tell the secret of their origin. It already indicates that the early peoples of India belonged to three great stocks, known as the Tibeto-Burman, the Kolarian, and the Dravidian.

Tibeto-Burmese.

The Tibeto-Burman tribes cling to the skirts of the Himálayas and their north-eastern offshoots. They crossed over into India by the north-eastern passes, and in some prehistoric time had dwelt in Central Asia, side by side with the forefathers of the Mongolians and the Chinese. Several of the hill languages in Eastern Bengal preserve Chinese terms, others contain Mongolian. Thus the Nágás in Assam still use words for *three* and *water* which might almost be understood in the streets of Canton.

The following are the twenty principal dialects of the Tibeto-Burman group:—(1) Cachárí or Bodo, (2) Garo, (3) Tripura or Mrung, (4) Tibetan or Bhutia, (5) Gurung, (6) Murmi, (7) Newar, (8) Lepcha, (9) Miri, (10) Aka, (11) Mishmi dialects, (12) Dhimal, (13) Kanáwari dialects, (14) Míkír, (15) Singpho, (16) Nága dialects, (17) Kuki dialects, (18) Burmese, (19) Khyeng, and (20) Manipuri.

"It is impossible," writes Mr Brandreth, "to give even an approximate number of the speakers included in this group, as many of the languages are either across the frontier or only project a short distance into our own territory. The languages included in this group have not, with perhaps one or two exceptions, both a cerebral and dental row of consonants, like the South-Indian languages; some of them have aspirated forms of the surds, but not of the sonants; others have aspirated forms of both. The languages of this group, even those which most diverge from each other, have several words in common, and especially numerals and pronouns, and also some resemblances of grammar. In comparing the resembling words, the differences between them consist often less in any modification of the root-syllable than in the various additions to the root. Thus in Burmese we have *ná*, 'ear;' Tibetan, *rna-ba*; Magar, *na-kep*; Newar, *nai-pong*; Dhimal, *ná-háthong*; Kiranti dialects, *ná-pro*, *ná-rék*, *ná-phák*; Nága languages, *te-na-ro*, *te-na-rang*; Manipuri, *na-kong*; Kupui, *ka-ná*; Sak, *aka-ná*; Karen, *na-khu*; and so on. It can hardly be doubted that such additions as these to monosyllabic roots are principally determinative syllables for the purpose of distinguishing between what would otherwise have been monosyllabic words having the same sound. These determinatives are generally affixed in the languages of Nepál and in the Dhimal language; prefixed in the Lepcha language, and in the languages of Assam, of Manipur, and of the Chittagong and Arakan hills. Words are also distinguished by difference of tone. The tones are generally of two kinds, described as the abrupt or short, and the pausing or heavy; and it has been remarked that those languages which are most given to adding other syllables to the root make the least use of the tones, and *vice versa*; where the tones most prevail the least recourse is had to determinative syllables."

Kolarian.

The Kolarians, the second of the three non-Aryan stocks, seem also to have entered Bengal by the north-eastern passes. They dwell chiefly in the north, and along the north-eastern edge of the three-sided table-land which covers the southern half of India. Some of the Dravidians, or third stock, appear, on the other hand, to have found their way into the Punjab by the north-western passes. They now inhabit the southern part of the three-sided table-land, as far down as Cape Comorin, the southernmost part of India. It appears as if the two streams of the Kolarian tribes from the north-east and the Dravidians from the north-west had converged and crossed each other in Central India. The Dravidians proved the stronger, broke up the Kolarians, thrust aside their fragments to east and west, and then rushed forward in a mighty body to the south.

It thus happened that, while the Dravidians formed a vast mass in southern India, the Kolarians survived only as isolated tribes, scattered so far apart as soon to forget their common origin. One of the largest of the Kolarian races, the Santáls, dwells on the extreme eastern edge of the three-sided table-land of Central India, where it slopes down into the Gangetic valley of Lower Bengal. The Kurkus, a broken Kolarian tribe, inhabit a patch of country about 400 miles to the west, and have for perhaps thousands of years been cut off from the Santáls by mountains and pathless forests, and by intervening races of the Dravidian and Aryan stocks. The Kurkus and Santáls have no tradition of a common origin; yet at this day the Kurkus speak a language which is little else than a dialect of Santáli. The Savars, once a great Kolarian tribe, mentioned by Pliny and Ptolemy, are now a poor wandering race of woodcutters of northern Madras and Orissa. Yet fragments of them have lately been found deep in Central India, and as far west as Rájputána on the other side.

The nine principal languages of the Kolarian group are—(1) Santáli, (2) Mundári, (3) Ho, (4) Bhumij, (5) Korwa, (6) Kharria, (7) Juang, (8) Kurku, and perhaps (9) Savar. Some of them are separated only by dialectical differences.

"The Kolarian group of languages," writes Mr Brandreth, "has both the cerebral and dental row of letters, and also aspirated forms, which last, according to Caldwell, did not belong to early Dravidian. There is also a set of four sounds, which are perhaps peculiar to Santáli, called by Skrefsrud semi-consonants, and which, when followed by a vowel, are changed respectively into *g*, *j*, *d*, and *b*. Gender of nouns is animate and inanimate, and is distinguished by difference of pronouns, by difference of suffix of a qualifying noun in the genitive relation, and by the gender being denoted by the verb. As instances of the genitive suffix, we have in Santáli *in-ren hopon*, 'my son,' but *in-ak orak*, 'my house.' There is no distinction of sex in the pronouns, but of the animate and inanimate gender. The dialects generally agree in using a short form of the third personal pronoun suffixed to denote the number, dual and plural, of the noun, and short forms of all the personal pronouns are added to the verb in certain positions to express both number and person, both as regards the subject and object, if of the animate gender,—the inanimate gender being indicated by the omission of these suffixes. No other group of languages, apparently, has such a logical classification of its nouns as that shown by the genders of both the South-Indian groups. The genitive in the Kolarian group of the full personal pronouns is used for the possessive pronoun, which again takes all the post-positions, the genitive relation being thus indicated by the genitive suffix twice repeated. The Kolarian languages generally express grammatical relations by suffixes, and add the post-positions directly to the root, without the intervention of an oblique form or genitive or other suffix. They agree with the Dravidian in having inclusive and exclusive forms for the plural of the first personal pronoun, in using a relative participle instead of a relative pronoun, in the position of the governing word, and in the possession of a true causal form of the verb. They have a dual, which the Dravidians have not, but they have no negative voice. Counting is by twenties instead of by tens, as in the Dravidian. The Santáli verb, according to Skrefsrud, has twenty-three tenses, and for every tense two forms of the participle and a gerund."

The compact Dravidians in the south, although in after-days subdued by the higher civilization of the Aryan race which pressed in among them, were never thus broken into fragments. Their pure descendants consist, indeed, of small and scattered tribes; but they have given their languages to 46 millions of people in southern India. That some of the islands in the distant Pacific Ocean were peopled either from the Dravidian settlements in India, or from an earlier common source, remains a conjectural induction of philologers, rather than an established ethnological fact.[1] The aboriginal tribes in southern and western Australia use almost the same words for *I*, *thou*, *he*, *we*, *you*, &c., as the fishermen on the Madras coast, and resemble in many other ways the Madras hill tribes, as in the use of their national weapon the boomerang.

Bishop Caldwell recognizes twelve distinct Dravidian languages:—(1) Tamil, (2) Malayálim, (3) Telugu, (4) Kanarese, (5) Tulu, (6) Kudugu, (7) Toda, (8) Kota, (9) Gond, (10) Khond, (11) Uráon, (12) Rájmahál.

"In the Dravidian group," writes Mr Brandreth, "there is a rational and an irrational gender of the nouns, which is distinguished in the plural of the nouns, and sometimes in the singular also, by affixes which appear to be fragmentary pronouns, by corresponding pronouns, and by the agreement of the verb with the noun, the gender of the verb being expressed by the pronominal suffixes. To give an instance of verbal gender, we have in Tamil, from the root *sey*, 'to do,' *seyd-án*, 'he (rational) did;'—*seyd-ál*, 'she (rational) did;' *seyd-adu*, 'it (irrational) did;' *seyd-ár*, 'they (the rationals) did;' *seyd-a*, 'they (the irrationals) did;'—the full pronouns being *avan*, 'he;' *aval*, 'she;' *adu*, 'it;' *avar*, 'they;' *avei*, 'they.' This distinction of gender, though it exists in most of the Dravidian languages, is not always carried out to the extent that it is in Tamil. In Telugu, Gond, and Khond it is preserved in the plural, but in the singular the feminine rational is merged in the irrational gender. In Gond the gender is further marked by the noun in the genitive relation taking a different suffix, according to the number and gender of the noun on which it depends. In Uráon the feminine rational is entirely merged in the irrational gender, with the exception of the pronoun, which preserves the distinction between rationals and irrationals in the plural; as *as*, 'he,' referring to a god or a man; *ád*, 'she,' or 'it,' referring to a woman or an irrational object; but *ár*, 'they,' applies to both men and women; *abrá*, 'they,' to irrationals only. The rational gender, besides human beings, includes the celestial and infernal deities; and it is further subdivided in some of the languages, but in the singular only, into masculine and feminine. An instance of this subdivision in the Tamil verb was given above.

"The grammatical relations in the Dravidian are generally expressed by suffixes. Many nouns have an oblique form, which is a remarkable characteristic of the Dravidian group; still, with the majority of nouns, the post-positions are added directly to the nominative form. Other features of this group are—the frequent use of formatives to specialize the meaning of the root; the absence of relative pronouns, and the use instead of a relative participle, which is usually formed from the ordinary participle by the same suffix as that which Dr Caldwell considers as the oldest sign of the genitive relation; the adjective succeeding the substantive; of two substantives, the determining preceding the determined; and the verb being the last member of the sentence. There is no true dual in the Dravidian languages. In the Dravidian languages there are two forms of the plural of the pronoun of the first person, one including, the other excluding, the person addressed. As regards the verbs, there is a negative voice, but no passive voice, and there is a causal form."

We discern, therefore, long before the dawn of history, masses of men moving uneasily over India, and violently pushing in among still earlier tribes. They crossed the snows of the Himálayas, and plunged into the tropical forests in search of new homes. Of these ancient races fragments now exist in almost exactly the same stage of human progress as they were when described by Vedic poets over three thousand years ago. Some are dying out, such as the Andaman islanders, among whom only one family in 1869 had so many as three children. Others are increasing, like the Santáls, who have doubled themselves under British rule. Taken as a whole, and including certain half-Hinduized branches, they number 17,716,825, or say 18 millions, equal to three-quarters of the population of England and Wales. But while the bolder or more

[1] See the authorities in Bishop Caldwell's *Comparative Grammar of the Dravidian Languages*, pp. 78–80, &c. (ed. 1857).

isolated of the aboriginal races have thus kept themselves apart, by far the greater portion submitted in ancient times to the Aryan invaders, and now make up the mass of the Hindus.

In Bengal and Assam the aborigines are divided into nearly sixty distinct races. In the North-Western Provinces sixteen tribes of aborigines are enumerated in the census of 1872. In the Central Provinces they number $1\frac{3}{4}$ millions,—the ancient race of Gonds, who ruled the central table-land before the rise of the Marhattás, alone amounting to $1\frac{1}{2}$ millions. In British Burmah the Karens, whose traditions have a singularly Jewish tinge, number 330,000. In Oudh the nationality of the aboriginal tribes has been stamped out beneath successive waves of Rájput and Mahometan invaders. In centres of the ancient Hindu civilization, the aboriginal races have become the low-castes and out-castes on which the social fabric of India rests. A few of them, however, still preserve their ethnical identity as wandering tribes or jugglers, basket-weavers, and fortune-tellers. Thus the Náts, Bediyas, and other gipsy clans are recognized to this day as distinct from the surrounding Hindu population.

The aboriginal races on the plains have supplied the hereditary criminal classes, alike under the Hindus, the Mahometans, and the British. Formerly organized robber communities, they have, under the stricter police administration of our days, sunk into petty pilferers. But their existence is still recognized by the Criminal Tribes Act, passed in 1871, and occasionally enforced within certain localities of northern India.

The non-Aryan hill races, who figured from Vedic times downwards as marauders and invaders, have ceased to be a disturbing element. Many of them appear as predatory clans in Mahometan and early British India. They sallied forth from their mountains at the end of the autumn harvest, pillaged and burned the lowland villages, and retired to their fastnesses laden with the booty of the plains. The measures by which many of these wild races have been reclaimed mark some of the most honourable episodes of Anglo Indian rule. Cleveland's Hill-Rangers in the last century, and the Bhíls and Mhairs in more recent times, are well-known examples of marauding races being turned into peaceful cultivators and loyal soldiers. An equally salutary transformation has taken place in many a remote forest and hill tract of India. The firm order of British rule has rendered their old plundering life no longer possible, and at the same time has opened up to them new outlets for their energies. Their character differs in many respects from that of the tamer population of the plains. Their truthfulness, sturdy loyalty, and a certain joyous bravery, almost amounting to playfulness, appeal in a special manner to the English mind. There is scarcely a single administrator who has ruled over them for any length of time without finding his heart drawn to them, and leaving on record his belief in their capabilities for good.

Primitive Hinduism.

We have seen that India may be divided into three regions. Two of these, the Himálayas in the north and the three-sided table-land in the south, still form the retreats of the non-Aryan tribes. The third, or the great river plains, became in very ancient times the theatre on which a nobler race worked out its civilization.

That race belonged to the splendid Aryan or Indo-Germanic stock, from which the Bráhman, the Rájput, and the Englishman alike descend. Its earliest home seems to have been in Central Asia. From this common camping-ground certain branches of the race started for the east, others for the west. One of the western offshoots founded the Persian kingdom; another built Athens and Lacedæmon, and became the Greek nation; a third went on to Italy, and reared the city on the seven hills which grew into imperial Rome. A distant colony of the same race excavated the silver-ores of prehistoric Spain; and, when we first catch a sight of ancient England, we see an Aryan settlement fishing in willow canoes, and working the tin-mines of Cornwall. Meanwhile other branches of the Aryan stock had gone forth from the primitive home in Central Asia to the east. Powerful bands found their way through the passes of the Himálayas into the Punjab, and spread themselves, chiefly as Bráhmans and Rájputs, over India.

The Aryan offshoots to the east and to the west alike asserted their superiority over the earlier peoples whom they found in possession of the soil. The history of ancient Europe is the story of the Aryan settlements around the shores of the Mediterranean; and that wide term, modern civilization, merely means the civilization of the western branches of the same race. The history and development of India consist of the history and development of the eastern offshoots of the Aryan stock who settled in that land. In the west, the Aryan speech has supplied the modern languages of Europe, America, and England's island empires in the southern Pacific. In the east, Hinduism and Buddhism, the religions of the Indian branch of the Aryans, have become the faiths of more than one-half of the whole human race, and spread Aryan thought and culture throughout Asia to the utmost limits of China and Japan.

Its home in Central Asia.

We know little regarding these noble Aryan tribes in their early camping-ground in Central Asia. From words preserved in the languages of their long-separated descendants in Europe and India, scholars infer that they roamed over the grassy steppes with their cattle, making long halts to rear crops of grain. They had tamed most of the domestic animals, were acquainted with some metals, understood the arts of weaving and sewing, wore clothes, and ate cooked food. They lived the hardy life of the temperate zone, and the feeling of cold seems to be one of the earliest common remembrances of the eastern and the western branches of the race. Ages afterwards, when the Vedic singers in hot India prayed for long life, they asked for "a hundred *winters*." The forefathers of the Greek and the Roman, of the Englishman and the Hindu, dwelt together in Asia, spoke the same tongue, worshipped the same gods. The languages of Europe and India, although at first sight they seem wide apart, are merely different forms of the original Aryan speech. This is especially true of the common words of family life. The names for *father*, *mother*, *brother*, *sister*, and *widow* are the same in most of the Aryan languages, whether spoken on the banks of the Ganges, of the Tiber, or of the Thames. Thus the word *daughter*, which occurs in nearly all of them, has been derived from two Sanskrit roots meaning "to draw milk," and preserves the memory of the time when the daughter was the little milk-maid in the primitive Aryan household.

The ancient religions of Europe and India had a similar origin. They were to some extent made up of the sacred stories or myths which our common ancestors had learned while dwelling together in Central Asia. Some of the Vedic gods were also the gods of Greece and Rome; and to this day the Deity is adored by names derived from the same old Aryan root by Bráhmans in Calcutta, by Protestant clergymen at Westminster, and by Catholic priests in Peru.

The Vedic hymns exhibit the Indian branch of the Aryans on its march to the south-east and in its new homes. The earliest songs disclose the race still to the north of the Khyber Pass, in Cabul; the later ones bring it as far as the Ganges. Their victorious advance eastwards through the intermediate tract can be traced in the Vedic writings almost step by step. One of their famous settlements lay between the two sacred rivers, the Saraswati and the Drishadvati,—supposed to be the modern Sarsuti near Thánesar, in the Punjab, and the Ghaggar, a day's march from it. That fertile strip of land, not more than 60 miles long by 20 broad, was fondly remembered by them as their Holy Land, "fashioned of God, and chosen by the Creator." As their numbers increased, they pushed eastwards along the base of the Himálayas, into what they afterwards called the Land of the Sacred Singers (*Bráhmarshidesha*). Their settlements practically included the five rivers of the Punjab, together with the other great river-system formed by the upper courses of the Jumna and the Ganges. In them the Vedic hymns were composed; and the steady supply of water led the Aryans to settle down from their old state of wandering pastoral tribes into communities of husbandmen. The Vedic poets praised the rivers which enabled them to make this great change—perhaps the most important step in the progress of a race. "May the Indus," they sang, "the far-famed giver of wealth, hear us,—(fertilizing our) broad fields with water." The Himálayas, through whose passes they had reached India, and at whose southern base they long dwelt, made a lasting impression on their memory. The Vedic singer praised "Him whose greatness the snowy ranges, and the sea, and the aerial river declare." In all its long wanderings through India the Aryan race never forgot its northern home. There dwelt its gods and holy singers, and their eloquence descended from heaven among men.

The *Rig-Veda* forms the great literary memorial of the early Aryan settlements in the Punjab. The age of this venerable hymnal is unknown. The Hindus believe, without evidence, that it existed "from before all time," or at least 3001 years B.C.,—nearly 5000 years ago. European scholars have inferred from astronomical dates that its composition was going on about 1400 B.C. But these dates are themselves given in writings of later origin, and might have been calculated backwards. We only know that the Vedic religion had been at work long before the rise of Buddhism in the 6th century B.C. Nevertheless, the antiquity of the *Rig-Veda*, although not to be expressed in figures, is abundantly established. The earlier hymns exhibit the Aryans on the north-western frontiers of India just starting on their long journey. Before the embassy of the Greek Megasthenes, at the end of the 4th century B.C., they had spread their influence as far as the delta of Lower Bengal, 1500 miles distant. At the time of the *Periplus* the southernmost point of India had become a seat of their worship. "What a series of centuries must have elapsed," writes Weber, "before this boundless tract of country, inhabited by wild and vigorous tribes, could have been brought over to Bráhmanism!"

The Bráhmans declare that the Vedic hymns were directly inspired by God. Indeed, in our own times, the great theistic church of Bengal, which rejects Bráhmanical teaching, was rent into two sects on the question of the divine authority of the *Veda*. As a matter of fact, the hymns were composed by certain families of Rishis or psalmists, some of whose names are preserved. The *Rig-Veda* is a very old collection of 1017 of these short lyrical poems, chiefly addressed to the gods, and containing 10,580 verses. They show us the Aryans on the banks of the Indus, divided into various tribes, sometimes at war with each other, sometimes united against the "black-skinned" aborigines. Caste, in its later sense, is unknown. Each father of a family is the priest of his own household. The chieftain acts as father and priest to the tribe; but at the greater festivals he chooses some one specially learned in holy offerings to conduct the sacrifice in the name of the people. The chief himself seems to have been elected; and his title of Vís-pati, literally "Lord of the Settlers," survives in the old Persian Vis-paiti, and as the Lithuanian Wiéz-patis in central Europe at this day. Women enjoyed a high position, and some of the most beautiful hymns were composed by ladies and queens. Marriage was held sacred. Husband and wife were both "rulers of the house" (*dampatí*), and drew near to the gods together in prayer. The burning of widows on their husbands' funeral-pile was unknown, and the verses in the *Veda* which the Bráhmans afterwards distorted into a sanction for the practice have the very opposite meaning. "Rise, woman," says the sacred text to the mourner; "come to the world of life. Come to us. Thou hast fulfilled thy duties as a wife to thy husband."

The Aryan tribes in the *Veda* are acquainted with most of the metals. They have blacksmiths, coppersmiths, and goldsmiths among them, besides carpenters, barbers, and other artisans. They fight from chariots, and freely use the horse, although not yet the elephant, in war. They have settled down as husbandmen, till their fields with the plough, and live in villages or towns. But they also cling to their old wandering life, with their herds and "cattle-pens." Cattle, indeed, still form their chief wealth, the coin (Latin, *pecunia*) in which payments of fines are made; and one of their words for war literally means "a desire for cows." They have learned to build "ships," perhaps large river-boats, and seem to have heard something of the sea. Unlike the modern Hindus, the Aryans of the *Veda* ate beef, used a fermented liquor or beer made from the *soma* plant, and offered the same strong meat and drink to their gods. Thus the stout Aryans spread eastwards through northern India, pushed on from behind by later arrivals of their own stock, and driving before them, or reducing to bondage, the earlier "black-skinned" races. They marched in whole communities from one river-valley to another, each house-father a warrior, husbandman, and priest, with his wife, and his little ones, and cattle. Ear Ary life.

These free-hearted tribes had a great trust in themselves and their gods. Like other conquering races, they believed that both themselves and their deities were altogether superior to the people of the land and their poor rude objects of worship. Indeed, this noble self-confidence is a great aid to the success of a nation. Their divinities—in Sanskrit, *Devata*, literally "the Shining Ones"—were the great powers of nature. They adored the Father-heaven, (*Dyaush-pitar*, the *Dies-piter* or *Jupiter* of Rome, the *Zeus* of Greece, the Low German *Duus*, and, through the old French god-demon *Dus-ius*, the *Deuce* of English slang), together with Mother-earth, and the Encompassing Sky (*Varuna* in Sanskrit, *Uranus* in Latin, *Ouranos* in Greek). Indra, or the aqueous vapour that brings each autumn the precious rain on which plenty or famine still depends, received the largest number of hymns. By degrees, as the settlers realized more and more keenly the importance of the periodical rains in their new life as husbandmen, he became the chief of the Vedic gods. "The gods do not reach unto thee, O Indra, nor men; thou overcomest all creatures in strength." Agni, the God of fire (Latin *igni-s*), ranks perhaps next to Indra in the number of hymns addressed to him as "the youngest of the gods," "the lord and giver of wealth." The Maruts are the Storm Gods, "who make the rocks to tremble, who tear in pieces the forest." Ushas, "the High-born Dawn" (Greek, *Eos*), "shines upon us like a young wife, rousing every living being to go forth to his work." The Asvins, or "Fleet Outriders" of the Dawn, are the first rays of sunrise, "Lords of Lustre." The Sun himself (Súrjya), the Wind (Váyu), the Friendly Day (Mitra), the animating fermented juice of the Sacrificial Plant (Soma) and many others, are invoked in the *Veda*,—in all about thirty-three gods, "who are eleven in heaven, eleven on earth, and eleven dwelling in glory in mid-air." Earl ligio

The terrible blood-drinking deities of modern Hinduism are scarcely known in the *Veda*. Buffaloes are indeed offered; and one hymn points to a symbolism based on human sacrifices, an early practice apparently extinct before the time of the Vedic singers. The great horse sacrifice was substituted for the flesh and blood of a man. But, as a whole, the hymns are addressed to bright, friendly gods. Rudra, who was destined to become the Siva of the Hindus, and the third person, or Destroyer, in their Triad, is only the god of Roaring Tempests in the *Veda*; Vishnu, the second person, or Preserver, in the Hindu Triad, is but slightly known as the deity of the Shining Firmament; while Brahma, the first person, or Creator, has no separate existence in these simple hymns. The names of the dreadful Mahádeva, Dúrga, Kálí, and of the gentler Krishna and Ráma, are equally unknown in the *Rig-Veda*.

While the aboriginal races buried their dead under rude stone monuments, the Aryan—alike in India, in Greece, and in Italy—made use of the funeral-pile as the most solemn method of severing the mortal from the immortal part of man. As he derived his natural birth from his parents, and a partial regeneration, or second birth, from the performance of his religious duties, so the fire, by setting free the soul from the body, completed the third or heavenly birth. His friends stood round the pyre as round a natal bed, and commanded his eye to go to the sun, his breath to the wind, his limbs to the earth,—the water and plants whence they had been derived. But "as for his unborn part, do thou, Lord (Agni), quicken it with thy heat; let thy flame and thy brightness quicken it; convey it to the world of the righteous." The doctrine of transmigration was unknown. The circle round the funeral-pile sang with an assurance that their friend went direct to a state of blessedness and reunion with the loved ones who had gone before.

The hymns of the *Rig-Veda* were composed, as we have seen, by the Aryans in their colonies along the Indus, and on their march eastwards towards the Jumna and upper Ganges. The growing numbers of the settlers, and the arrival of fresh Aryan tribes from behind, still compelled them to advance. From the Land of the Sacred Singers Manu describes them as spreading through "The Middle Land" (*Madhyadesha*), comprising the whole river systems of Upper India as far east as Oudh and Allahábád, with the Himálayas as its northern and the Vindhyá ranges as its southern boundary. The conquest of the vast new tracts thus included seems not to have commenced till the close of the Rig-Vedic era, and it must have been the work of many generations. During this advance the simple faith of the Rig-Vedic singers was first adorned with stately rites, and then extinguished beneath them. The race progressed from a loose confederacy of tribes into several well-knit nations, each bound together by the strong central force of kingly power, directed by a powerful priesthood and organized on a firm basis of caste.

te. Whence arose this new constitution of the Aryan tribes into nations, with castes, priests, and kings? We have seen that, although in their earlier colonies on the Indus each father was priest in his family, yet the chieftain, or lord of the settlers, called in some man specially learned in holy offerings to conduct the great tribal sacrifices. Such men were highly honoured, and the famous quarrel which runs throughout the whole *Veda* sprang from the claims of two rival sages, Vashishtha and Visvámitra, to perform one of these ceremonies. The art of writing was unknown, and the hymns and sacrificial words had to be handed down by word of mouth from father to son. It thus happened that the families who learned them by heart became, as it were, the hereditary owners of the liturgies required at the most solemn offerings to the gods. Members of these households were chosen again and again to conduct the tribal sacrifices, to chant the battle-hymn, to implore the divine aid, or to pray away the divine wrath. Even the *Rig-Veda* recognizes the importance of these sacrifices. "That king," says a verse, "before whom marches the priest, he alone dwells well-established in his own house, to him the people bow down. The king who gives wealth to the priest, he will conquer, him the gods will protect." The tribesmen first hoped, then believed, that a hymn or prayer which had once acted successfully, and been followed by victory, would again produce the same results. The hymns became a valuable family property for those who had composed or learned them. The *Rig-Veda* tells how the prayer of Vashishtha prevailed "in the battle of the ten kings," and how that of Visvámitra "preserves the tribe of the Bhárats." The potent prayer was termed *bráhma*, and he who offered it *bráhman*. Woe to all who despised either! "Whosoever," says the *Rig-Veda*, "scoffs at the prayer (*bráhma*) which we have made, may hot plagues come upon him, may the sky burn up that hater of Bráhmans" (*bráhma-dvísh*). Certain families thus came to have, not only an hereditary claim to conduct the great sacrifices, but also the exclusive knowledge of the ancient hymns, or at any rate of the traditions which explained their symbolical meaning. They naturally tried to render the ceremonies solemn and imposing. By degrees a vast array of ministrants grew up around each of the greater sacrifices. There were first the officiating priests and their assistants, who prepared the sacrificial ground, dressed the altar, slew the victims, and poured out the libations; second, the chanters of the Vedic hymns; third, the reciters of other parts of the service; fourth, the superior priests, who watched over the whole, and corrected any mistakes.

Meanwhile other castes had been gradually formed. As the Aryans moved eastwards from the Indus, some of the warriors were more fortunate than others, or received larger shares of the conquered lands. Such families had not to till their fields with their own hands, but could leave that work to be done by the aboriginal races whom they subdued. In this way there grew up a class of warriors, freed from the labour of husbandry, who surrounded the chief or king, and were always ready for battle. It seems likely that these kinsmen and "companions of the king" formed an important class among the early Aryan tribes in India, as they certainly did among the ancient branches of the race in Europe, and still do at the petty courts of India. Their old Sanskrit names, *Kshattriya*, *Rájanya*, and *Rájbansi*, mean "connected with the royal power," or "of the royal line"; their usual modern name *Rájput* means "of royal descent." In process of time, when the Aryans settled down, not as mere fighting clans, but as powerful nations, in the middle land along the Jumna and Ganges, this warrior class grew in numbers and in power. The black races had been reduced to serfdom, or driven back into the Himálayas and the Vindhyás, on the north and the south of that fertile tract. The incessant fighting, which had formed the common lot of the tribes on their actual migration eastwards from the Indus, ceased. A section of the people laid aside their arms, and devoted themselves to agriculture or other peaceful pursuits. The sultry heats of the Middle Land must also have abated their old northern energy, and led them to love repose. Those who, from family ties or from personal inclination, preferred a soldier's life had to go beyond the frontier to find an enemy. Distant expeditions of this sort could be undertaken much less conveniently by the husbandman than in the ancient time, when his fields lay on the very border of the enemy's country, and had just been wrested from it. Such expeditions required and developed a class of regular soldiers whose presence was not constantly needed at home for tilling the land. The old warrior companions and kinsmen of the king formed a nucleus round which gathered all the more daring spirits, and laid the foundation of a military caste. The Aryans on the Ganges, in the "Middle Land," thus found themselves divided into three classes—first, the priests, or Bráhmans; second, the warriors and king's companions, called in ancient times Kshattriyas, at the present day Rájputs; third, the husbandmen, or agricultural settlers, who retained the old name of Vaisyas, from the root *vis*, which in the Vedic period had included the whole "people." These three classes gradually became distinct castes; intermarriage between them ceased, and each kept more and more strictly to its hereditary employment. But they were all recognized as belonging to the "twice-born" or Aryan race, were all present at the great national sacrifices, and all worshipped the same bright gods. Beneath them was a fourth or servile class, called Súdras, the remnants of the vanquished aboriginal tribes whose lives had been spared. These were "the slave-bands of black descent," the Dásas of the *Veda*. They were distinguished from their "twice-born" Aryan conquerors as being only "once-born," and by many contemptuous epithets. They were not allowed to be present at the great national sacrifices, nor at the feasts which followed them. They could never rise from their servile condition, and to them was assigned the severest toil in the fields, and all the hard and dirty work of the village community. Of the four Indian castes, three had a tendency to increase. As the Aryan conquests spread, more aboriginal tribes were reduced to serfdom as Súdras. The warriors, or Kshattriyas, would constantly receive additions from the more wealthy or enterprising members of the cultivating class. When an expedition or migration went forth to subdue new territory, all the colonists would for a time lead a military life, and their sons would probably all regard themselves as Kshattriyas. In ancient times entire tribes, and at the present day the mass of the population throughout large tracts, thus claim to be of the warrior or Rájput caste. Moreover, the kings and chief fighting-men of aboriginal races who, without being conquered by the Aryans, entered into alliance with them, would likely assume names of the warrior or Kshattriya rank. We see this process going on before our eyes among many of the aboriginal peoples. The Bráhmans, in their turn, seem at first to have received into their body distinguished families of Kshattriyan descent. In later times, too, we find that sections of aboriginal races were "manufactured" into Bráhmans. The Vaisya or cultivating caste did not tend in this manner to increase. No one felt ambitious to win his way into it, except perhaps the poor Súdras, to whom any change of condition was forbidden. The Vaisyas themselves tended in early times to rise into the more honourable warrior class, and at a later period to be mingled with the labouring multitude of Súdras and mixed descent. In many provinces they have almost disappeared as a distinct caste from the modern population. In ancient India, as at the present day, the three conspicuous castes were (1) the priests and (2) warriors, of Aryan birth, and (3) the serfs or Súdras, the remnants of earlier races. The Kshattriyas or Rájputs, at any rate in some parts of India, seem to represent a quite separate ethnical movement from that of the Bráhmans—that is to say, either a different Aryan migration into India, or an altogether distinct race of perhaps Scythic origin. The Súdras had no rights, and, once conquered, ceased to struggle against their fate. But a long contest raged between the priests and warriors for the chief place in the Aryan commonwealth.

Bráhmans.

In order to understand that contest, we must go back to the time when the priests and warriors were simply fellow-tribesmen. The priestly or Bráhman caste grew slowly out of the families of Rishis who composed the Vedic hymns, or were chosen to conduct the great tribal sacrifices. In after times the whole Bráhman population of India pretended to trace their descent from seven Rishis. But the composers of the Vedic hymns were sometimes kings or distinguished warriors rather than priests; the *Veda* itself speaks of these royal Rishis (*Rájarshis*). When the Bráhmans put forward their claim to the highest rank, the warriors or Kshattriyas were slow to admit it; and, when the Bráhmans went a step farther, and declared that only members of their families could be priests, or gain admission into the priestly caste, the warriors disputed their pretensions. In later ages the Bráhmans, having the exclusive keeping of the sacred writings, effaced from them, as far as possible, all traces of the struggle. They taught that their caste had come forth from the mouth of God, divinely appointed to the priesthood from the beginning of time. Nevertheless, a large body of Vedic verses and Sanskrit texts has now been brought to bear upon the struggle between the Bráhmans and Kshattriyas for the highest rank.[1]

In many of the Aryan tribes, however, the priests failed to establish themselves as an exclusive order. Indeed, the four castes, and especially the Bráhman caste, seem only to have obtained their full development amid the plenty of the Middle Land (*Madhyadesha*), watered by the Jumna and the Ganges. The earlier Aryan settlements to the west of the Indus remained outside the caste system; the later Aryan offshoots to the south and east of the middle land only partially carried that system with them. But in the Middle Land itself, with Delhi as its western capital and the great cities of Ajodhya and Benares on its eastern frontier, the Bráhmans grew by degrees into a compact, learned, and supremely influential body, the makers of Sanskrit literature. Their language, their religion, and their laws became in after times the standards aimed at throughout all India. They naturally denounced all who did not submit to their pretensions, and stigmatized the other Aryan settlements who had not accepted their caste system as lapsed tribes or outcastes (*Vrishalas*). Among the lists of such fallen races we read the name afterwards applied to the Ionians or Greeks (*Yavanas*). The Bráhmans of the middle land had not only to enforce their supremacy over the powerful warriors of their own kingdoms, but to extend it among the Aryan tribes who had never fully accepted the caste system. That must have been the slow work of ages, and it seems to have led to bitter feuds. See BRAHMANISM, vol. iv. p. 201.

Br... m... al la... co...

While the Bráhmans claimed religion, theology, and philosophy as their special domain, and the chief sciences and arts as supplementary sections of their divinely-inspired knowledge, they secured their social supremacy by codes of law. Their earliest *Dharma-sástras*, or legal writings, belong to the Sútra period, or scholastic development, of the *Veda*. But their two great digests, upon which the fabric of Hindu jurisprudence has been built up, are of later date. The first of these, the code of Manu, is separated from the Vedic era by a series of Bráhmanical developments, of which we possess only a few of the intermediate links. It is a compilation of the customary law current probably about the 5th century B.C., and exhibits the social organization which the Bráhmans, after their

[1] The quarrel between the two sages Visvámitra and Vashishtha, which runs through the whole *Veda*, is typical of this struggle. Visvámitra stands as a representative of the royal-warrior rank, who claims to perform a great public sacrifice. The white-robed Vashishtha represents the Bráhmans or hereditary priesthood, and opposes the warrior's claim. In the end Visvámitra established his title to conduct the sacrifice; but the Bráhmans explain this by saying that his virtues and austerities won admission for him into the priestly family of Bhrigus. He thus became a Bráhman, and could lawfully fill the priestly office. Visvámitra serves as a typical link, not only between the priestly and the worldly castes, but also between the sacred and the profane sciences. He was the legendary founder of the art of war, and his son Susru-fa is quoted as the earliest authority on Indian medicine. These two sciences of war and medicine form *upa-Vedas*, or supplementary sections of the divinely inspired knowledge of the Bráhmans. Another royal Rishi, Vítahavya, "attained the condition of Bráhmanhood, venerated by mankind," by a word of the saintly Bhrigu. Parasu-Ráma, the divine champion of the Bráhmans, was of warrior descent by his mother's side. Manu, their legislator, sprang from the warrior caste; and his father is expressly called "the seed of all the Kshattriyas." But when the Bráhmans had firmly established their supremacy they became reluctant to allow the possibility of even princes finding an entrance into their sacred order. King Ganaka was more learned than all the Bráhmans at his court, and performed terrible penances to attain to Bráhmanhood. Yet the legends leave it doubtful whether he gained his desire. The still more holy but probably later Matanga wore his body to skin and bone by a thousand years of austerities, and was held from falling by the hand of Indra himself. Nevertheless, he could not attain to Bráhmanhood. The reformer, Gautama Buddha, who in the 6th century before Christ overthrew the Bráhman supremacy, and founded a new religion, was a prince of warrior descent, perhaps born in too late an age to be adopted into and utilized by the Bráhman caste.

successful struggle for the supremacy, had established in the Middle Land of Bengal. The Bráhmans, indeed, claimed for their laws a divine origin, and ascribed them to the first Manu, or Aryan man, 30 millions of years ago. But, as a matter of fact, the laws of Manu are the result of a series of attempts to codify the usages of some not very extensive centre of Bráhmanism in northern India,—a metrical digest of local customs condensed by degrees from a legendary mass of 100,000 couplets (*slokas*) into 2684. They may possibly have been reduced to their final form of a written code with a view to securing the system of caste against the popular movement of Buddhism, and thus giving a rigid fixity to the privileges of the Bráhmans.

The second great code of the Hindus, that of Yájnavalkya, belongs to a period when Buddhism had established itself, and probably to a territory where it was beginning to succumb to the Bráhmanical reaction. It represents the Bráhmanical side of the great controversy (although a section of it deals with the organization of monasteries), refers to the execution of deeds on metal plates, and altogether marks an advance in legal precision. Its compilation belongs to a period apparently not earlier than the 2d century A.D., and certainly not later than the 6th or 7th.

These codes deal with Hindu law in three branches, namely—(1) domestic and civil rights and duties, (2) the administration of justice, (3) purification and penance. They stereotyped the unwritten usages which regulated the family life and social organization of the old Aryan communities in the middle land. They did not pretend to supply a body of law for all the numerous races of India, but only for Hindu communities of the Bráhmanical type. It is doubtful whether they quite accurately represent the actual customary law even in such communities, for they were apparently drawn up with a view to asserting and maintaining the special privileges of the Bráhmans. This they effect by a rigid demarcation of the employments of the people, each caste or division of a caste having its own hereditary occupation assigned to it; by stringent rules against intermingling the castes by marriage; by forbidding the higher castes, under severe penalties, to eat or drink or hold social intercourse with the lower; and by punishing the lower castes with still more cruel penances for defiling by their touch the higher castes, or in any way infringing on their privileges. They exhibit the Hindu community in the four ancient divisions of priests, warriors, cultivators, and serfs (*súdras*). But they disclose that this old Aryan classification failed to represent the actual facts even of the Aryan communities in northern India. They admit that the mass of the people did not belong to any one of the four castes, and ascribe its origin to mixed concubinage or illicit connexions. The ancient Bráhmanical communities in northern India, as revealed by the codes themselves, consisted—first, of an Aryan element divided into priests, warriors, and cultivators, all of whom bore the proud title of the twice-born, and wore the sacred thread; second, of the subjugated races, "the once-born" Súdras; and third, of the vast residue of the Varna-sankara, literally the "mingled colours," a great but uncertain number of castes to whom was assigned a mixed descent from the four recognized classes. The same division exists to this day. According to the census of 1871, the separate tribes and castes in Lower Bengal do not fall short of a thousand; in the North-Western Provinces the Hindu population was arranged under two hundred and ninety-one specified castes besides numerous subdivisions. The distinctly recognized "mixed castes" throughout British India cannot be estimated at less than three hundred, and probably amount to many more.

As the Bráhmans spread their influence eastwards and southwards from the Middle Land, they carried their codes with them. The number of their sacred law books (*Dharma-sástras*) amounted to at least fifty-six, and separate schools of Hindu law sprang up. Thus the Dáyabhága version of the law of inheritance prevails in Bengal while the Mitákshará commentary on Yájnavalkya is current in Madras and throughout southern and western India. But all modern recensions of Hindu law rest upon the ancient codes; and these codes, as we have seen, only recorded the usages of certain Bráhmanical centres in the north, and perhaps did not fairly record even them. As the Bráhmans gradually moulded the population of India into Hinduism, such codes proved too narrow a basis for dealing with the rights, duties, and social organization of the people. The later Hindu legislators, accordingly, inculcated the recognition of the local usages or land-law of each part of the country, and of each class or tribe. While binding together and preserving the historical unity of the Aryan twice-born castes by systems of law founded on their ancient codes, they made provision for the customs and diverse stages of civilization of the ruder peoples of India, over whom they established their ascendency. By such provisions, alike in religion and law, the Bráhmans incorporated the Indian races into that loosely coherent mass known as the Hindu population.

It is to this plastic element that Hinduism owes its success; and it is an element which English administrators have sometimes overlooked. The races of British India exhibit many stages of domestic institutions from the polyandry of the Nairs to the polygamy of the Kulin Bráhmans. The structure of their industrial organization varies, from the nomadic husbandry of the Burmese to the long chain of tenures which in Bengal stretches from the proprietor through a series of middle-men to the actual tiller of the soil. Every stage in human progress is represented, from the hunting tribes of the central plateau to the rigid trade-guilds of Guzerat. The Hindu legislators recognized that each of these diverse stages of social development had its own usages and common law. Vrihaspati says: "The laws (*dharma*) practised by the various countries, castes, and tribes, they are to be preserved; otherwise the people are agitated." Devala says: "What gods there are in any country, . . . and whatsoever be the custom and law anywhere, they are not to be despised there; the law there is such." Varáhamihira says: "The custom of the country is first to be considered; what is the rule in each country, that is to be done." The most learned English scholar in southern India has thus summed up the matter: "By custom only can the Dharma-sástra [Hindu law] be the rule of others than Bráhmans [only one-thirtieth of the population of Madras], and even in the case of Bráhmans it is very often superseded by custom."[1]

The English, on assuming the government of India, wisely declared that they would administer justice according to the customs of the people. But the high courts enforce the Bráhmanical codes with a comprehensiveness and precision unknown in ancient India. Thus in Bengal the custom of *sagai*, by which deserted or divorced wives among the lower castes marry again, was lately tried according to "the spirit of Hindu law"; while in Madras learned judges have pointed out a divergence between the Hindu law as now administered and the actual usages of the people. Those usages are unwritten and uncertain. The Hindu law is printed in many accessible forms, and Hindu barristers are ever pressing its principles upon the courts. Efforts at comprehensive codification in British India are thus surrounded by special difficulties, for it would be improper to give the fixity of a code to all the unwritten half-fluid usages current among the three-hundred unhomogeneous castes of Hindus, while it might be fraught with future injustice to exclude any of them. Each age has the gift of adjusting its institutions to its actual wants, especially among tribes whose customs have not been reduced to written law. Many of those customs will, if left to themselves, die out; others of them, that prove suited to the new social developments under British rule, will live. But the process of natural selection must be, to some extent, the work of time, and not a single act of conscious legislation. This has been recognized by the ablest of Anglo-Indian codifiers. They apply the word code to the systematic arrangement of the rules relating to some well-marked section of juristic rights, or to some executive department of the administration of justice. "In its larger sense," write the Indian Law Commissioners, 1879, "of a general assemblage of all the laws of a community, no attempt has yet been made in this country to satisfy the conception of a code. The time for its realization has manifestly not arrived."

The Bráhmans were not merely the depositaries of the sacred books, the philosophy, the science, and the laws of the ancient Hindu commonwealth; they were also the creators and custodians of its secular literature. They had a practical monopoly of Vedic learning, and their policy was to trace back every branch of knowledge and intellectual effort to the *Veda*.

Bráhman civilization.

In order to understand the long domination of the Bráhmans and the influence which they still wield, it is necessary to keep in mind their position as the great literary caste. Their priestly supremacy has been repeatedly assailed, and was during a space of several hundred years overthrown. But throughout twenty-two centuries they have been the counsellors of Hindu princes and the teachers of the Hindu people. They represent the early Aryan civilization of India; and the essential history of the Hindus is a narrative of the attacks upon the continuity of that civilization,—that is to say, of attacks upon the Bráhmanical system of the Middle Land, and of the modifications and compromises to which that system has had to submit. Those attacks range themselves under six epochs:—first, the religious uprising of the half-Bráhmanized Aryan tribes on the east of the Middle Land, initiated by the preaching of Buddha in the 6th century B.C., culminating in the Buddhist kingdoms

[1] Dr Burnell's *Dáya-Vibhága*, Introd. p. xv.; see also *The Hindu Law as administered by the High Court of Judicature at Madras*, by J. Nelson, M.A., District Judge of Cuddapah, chaps. iii. and iv. (Madras, 1877).

about the commencement of our era, and melting into modern Hinduism about the 8th century A.D.; second, warlike inroads of non-Bráhmanical Aryans or other races from the west, commencing with the Greek invasions in the 4th century B.C., and continuing under the Græco-Bactrian empire and its successors to probably the 3d or 5th century A.D.; third, the influence of the non-Aryan tribes of India and of the non-Aryan low-castes incorporated from them, —an influence ever at work, indeed by far the most powerful agent in dissolving Bráhmanism into Hinduism, but represented in a special manner by the non-Aryan kingdoms about the 7th and 8th centuries A.D.; fourth, the reaction against the low beliefs, priestly oppression, and bloody rites which resulted from this compromise between Bráhmanism and aboriginal worship, a reaction which received an impetus from the preaching of Sankar-Achárjya, who founded a philosophical Sivaite sect in the 8th or 9th century, and received its full development under a line of great Vishnuvite reformers from the 12th to the 16th centuries A.D.; fifth, Mahometan invasions and the rule of Islám, 1000 to 1765 A.D.; sixth, the English supremacy, and the great popular upheaval which it has produced in the 18th and 19th centuries.

Buddhist Period.

(6th century B.C. to 8th century A.D.)

Buddhism. The first great solvent of Bráhmanism was the teaching of Buddha. The life of this celebrated man has three sides,—its personal aspects, its legendary developments, and its religious consequences upon mankind. In his own person Buddha appears as a prince and preacher of ancient India. In the legendary developments of history Buddha ranks as a divine teacher among his followers, as an incarnation of Vishnu among the Hindus, and apparently as a saint of the Christian church, with a day assigned to him in both the Greek and Roman calendars. As a religious founder he left behind him a system of beliefs which has gained more disciples than any other creed in the world, and which, after a lapse of twenty-four centuries, is now professed by 500 millions of people, or more than one-third of the human race.

The life of Buddha is related at length under BUDDHISM, vol. iv. p. 424. In this place it is unnecessary to give more than a brief sketch of the history of Buddhism in India.

On the death of Buddha, five hundred of his disciples met in a cave near Rájágriha, to gather together his sayings. This was the first council. They chanted the lessons of their master in three great divisions—the words of Buddha to his disciples, his code of discipline, and his system of doctrine. These became the three collections of Buddha's teaching, and the word for a Buddhist council means literally "a singing together." A century afterwards, a second council of seven hundred was held at Vaisali, to settle disputes between the more and the less strict followers of Buddhism. It condemned a system of ten "indulgences" which had grown up, but it led to the separation of the Buddhists into two hostile parties, who afterwards split into eighteen or more sects.

Spread of Buddhism. During the next two hundred years Buddhism spread over northern India, perhaps receiving a new impulse from the Greek kingdoms in the Punjab. About 244 B.C. Asoka, the king of Magadha or Behar, became a zealous convert to Buddhism. He is said to have supported 64,000 Buddhist priests; he founded many religious houses, and his kingdom is called the Land of the Monasteries (Vihára or Behar) to this day. He did for Buddhism what Constantine afterwards effected for Christianity; he organized it on the basis of a state religion. This he accomplished by five means—by a council to settle the faith, by edicts promulgating its principles, by a state department to watch over its purity, by missionaries to spread its doctrines, and by an authoritative collection of its sacred books. In 244 B.C. Asoka convened at Patná the third Buddhist council of one thousand elders. Evil men, taking on them the yellow robe of the order, had given forth their own opinions as the teaching of Buddha. Such heresies were now corrected; and the Buddhism of southern Asia practically dates from Asoka's council. In a number of edicts, both before and after the synod, he published throughout India the grand principles of the faith. Such edicts are still found graven deep upon pillars, in caves, and on rocks, from the Yusafzai valley beyond Pesháwar on the north-western frontier, through the heart of Hindustán, to Káthiáwár and the Central Provinces on the south and Orissa in the east. Tradition states that Asoka set up 64,000 memorial columns or topes; and the thirty inscriptions extant in our own day show how widely these royal sermons were spread over India. In the year of the council, the king also founded a state department to watch over the purity and to direct the spread of the faith. A minister of justice and religion (Dharma Mahámátra) directed its operations; and, one of its first duties being to proselytize, he was specially charged with the welfare of the aborigines among whom its missionaries were sent. Asoka did not think it enough to convert the inferior races without looking after their material interests. Wells were to be dug and trees planted along the roads; a system of medical aid was established throughout his kingdom and the conquered provinces, as far as Ceylon, for both man and beast. Officers were appointed to watch over domestic life and public morality, and to promote instruction among the women as well as the youth.

Asoka's edicts.

Asoka recognized proselytism by peaceful means as a state duty. The rock inscriptions record how he sent forth missionaries "to the utmost limits of the barbarian countries," to "intermingle among all unbelievers" for the spread of religion. They shall mix equally with Bráhmans and beggars, with the dreaded and the despised, both within the kingdom "and in foreign countries, teaching better things." Conversion is to be effected by persuasion, not by the sword. Buddhism was at once the most intensely missionary religion in the world and the most tolerant. This character of a proselytizing faith which wins its victories by peaceful means, so strongly impressed upon it by Asoka, has remained a prominent feature of Buddhism to the present day. Asoka, however, not only took measures to spread the religion; he also endeavoured to secure its orthodoxy. He collected the body of doctrine into an authoritative version, in the Magadhi language or dialect of his central kingdom in Behar,—a version which for two thousand years has formed the canon (*pitakas*) of the southern Buddhists.

The fourth and last of the great councils was held under King Kanishka, according to one tradition, four hundred years after Buddha's death. The date of Kanishka is still uncertain; but, from the evidence of coins and inscriptions, his reign has been fixed in the 1st century after Christ, or, say, 40 A.D. Kanishka, the most famous of the Saka conquerors, ruled over north-western India and the adjoining countries. His authority had its nucleus in Kashmír, but it extended to both sides of the Himálayas, from Yarkand and Khokan to Agra and Sind. His council of five hundred compiled three commentaries on the Buddhist faith. These commentaries supplied in part materials for the Tibetan or northern canon, drawn up at a subsequent period. The northern canon, or, as the Chinese proudly call it, the "greater vehicle of the law," includes many later corruptions or developments of the Indian faith as originally embodied by Asoka (244 B.C.) in the "lesser vehicle," or canon of the southern Buddhists.

The Kanishka commentaries were written in the Sanskrit language, perhaps because the Kashmír and northern priests who formed his council belonged to isolated Aryan colonies, which had been little influenced by the growth of the Indian vernacular dialects. In this way Kanishka and his Kashmír council (? 40 A.D.) became in some degree to the northern or Tibetan Buddhists what Asoka and his Patná council (244 B.C.) had been to the Buddhists of Ceylon and the south.

The missionary impulse given by Asoka quickly bore fruit. In the year after his great council at Patná his son Mahindo carried Asoka's version of the Buddhist scriptures in the Magadhi language to Ceylon. He took with him a band of fellow missionaries; and soon afterwards his sister, the princess Sanghamitta, who had entered the order, followed with a company of nuns. It was not, however, till six hundred years later (410–432 A.D.) that the holy books were rendered into Páli, the sacred language of the southern Buddhists. About the same time missionaries from Ceylon finally established the faith in Burmah (450 A.D.). The Burmese themselves assert that two Buddhist preachers landed in Pegu as early as 207 B.C. Some indeed place their arrival just after the Patná council (244 B.C.), and point out the ruined city of Tha-ton, between the Tsi-tang and Salwín estuaries, as the scene of their pious labours. Siam was converted to Buddhism in 638 A.D.; Java received its missionaries direct from India between the 5th and the 7th centuries, and spread the faith to Bali and Sumatra. While southern Buddhism was thus wafted across the ocean, another stream of missionaries had found its way by Central Asia into China. Their first arrival in that empire is said to date from the 2d century B.C., although it was not till 65 A.D. that Buddhism there became an established religion. The Græco-Bactrian kingdoms in the Punjab and beyond it afforded a favourable soil for the faith. The Scythian dynasties that succeeded them accepted it, and the earliest remains which recent discovery has unearthed in Afghánistán are Buddhist. Kanishka's council, soon after the commencement of the Christian era, gave a fresh impetus to the faith. Tibet, south Central Asia, and China lay along the great missionary routes of northern Buddhism; the Kirghis are said to have carried Buddhist settlements as far west as the Caspian; on the east, the religion was introduced into the Korea in 372 A.D., and thence into Japan in 552.

Buddhism never ousted Bráhmanism from any large part of India. The two systems co-existed as popular religions during more than a thousand years (244 B.C. to about 800 A.D.), and modern Hinduism is the joint product of both. Certain kings and certain eras were intensely Buddhistic; but the continuous existence of Bráhmanism is abundantly proved from the time of Alexander (327 B.C.) downwards. The historians who chronicled his march, and the Greek ambassador Megasthenes, who succeeded them (300 B.C.) in their literary labours, bear witness to the predominance of the old faith in the period immediately preceding Asoka. Inscriptions, local legends, Sanskrit literature, and the drama disclose the survival of Bráhman influence during the next six centuries (244 B.C. to 400 A.D.). From 400 A.D. we have the evidence of the Chinese pilgrims, who toiled through Central Asia into India as the birthplace of their faith. Fa-Hian entered India from Afghánistán, and journeyed down the whole Gangetic valley to the Bay of Bengal in 399–413 A.D. He found Bráhman priests equally honoured with Buddhist monks, and temples to the Indian gods side by side with the religious houses of his own faith. Hwen Tsang also travelled to India from China by the Central Asia route, and has left a fuller record of the state of the two religions in the 7th century. His journey extended from 629 to 645 A.D., and everywhere throughout India he found the two faiths eagerly competing for the suffrages of the people. By that time, indeed, Bráhmanism was beginning to assert itself at the expense of the other religion. The monuments of the great Buddhist monarchs, Asoka and Kanishka, confronted him from the time he neared the Punjab frontier; but so also did the temples of Siva and his "dread" queen Bhímá. Throughout north-western India he found Buddhist convents and monks surrounded by "swarms of heretics." The political power was also divided, although the Buddhist sovereigns predominated. A Buddhist monarch ruled over ten kingdoms in Afghánistán. At Peshávar the great monastery built by Kanishka was deserted, but the populace remained faithful. In Kashmír king and people were devout Buddhists, under the teaching of five hundred monasteries and five thousand monks. In the country identified with Jáipur, on the other hand, the inhabitants were devoted to heresy and war.

Buddhist influence in northern India seems, during the 7th century A.D., to have centred in the fertile doáb or plain between the Jumna and the Ganges. At Kanauj (Kanyákubja), on the latter river, Hwen Tsang found a powerful Buddhist monarch, Síláditya, whose influence reached from the Punjab to north-eastern Bengal, and from the Himálayas to the Narbadá river. There flourished one hundred Buddhist convents and ten thousand monks. But the king's eldest brother had been lately slain by a sovereign of eastern India, a hater of Buddhism; and two hundred temples to the Bráhman gods reared their heads under the protection of the devout Síláditya himself. This monarch seems to have been an Asoka of the 7th century A.D., and he practised with primitive vigour the two great Buddhist virtues of spreading of the faith and charity. The former he attempted by means of a general council in 634 A.D. Twenty-one tributary sovereigns attended, together with the most learned Bráhman and Buddhist monks of their kingdoms. But the sole object of the convocation was no longer the undisputed assertion of the Buddhist religion. It dealt with the two distinct phases of the religious life of India. First there was a discussion between the Buddhists and Bráhmans, especially of the Sánkhya and Vaiseshika schools, and then followed a dispute between the two Buddhist sects who followed respectively the northern and the southern canons, known as "the greater and the lesser vehicle of the law." The rites of the populace were of as composite a character as the doctrines of their teachers. On the first day of the council a statue of Buddha was installed with great pomp; on the second, an image of the sun-god; on the third, a figure of Siva.

Síláditya held a solemn distribution of his royal treasures every five years. Hwen Tsang describes how on the plain near Allahábád, where the Ganges and the Jumna unite their waters, all the kings of the empire, and a vast multitude of people, were feasted for seventy-five days. Síláditya brought forth the stores of his palace, and gave them away to Bráhmans and Buddhists, monks and heretics, without distinction. At the end of the festival he stripped off his jewels and royal raiment, gave them to the bystanders, and, like Buddha of old, put on the rags of a beggar. By this ceremony the monarch commemorated the Great Renunciation of the founder of the Buddhist faith, and at the same time practised the highest duty inculcated alike by the Buddhist and Bráhmanical religions, namely, almsgiving. Hwen Tsang describes a distribution on a smaller scale in the western kingdom of Valabhí (*circa* 636 A.D.). "For seven days every year the king holds a great assembly at which he distributes to the multitude of recluses choice dishes, the three garments, medicine, the seven precious things, and rare objects of great value. After giving all these in alms he buys them back at double price." The intellect of this king, we are told, was weak and narrow.[1] Similar "fields of charity" seem to have been held by many Buddhist princes in memory of the Great Renunciation. The vast monastery of Nalanda in Behar formed a seat of learning which recalls the universities of mediæval Europe. Ten thousand monks and novices of the eighteen schools there studied theology, philosophy, law, science, especially medicine, and practised their devotions. They were supported from the royal funds.

Hwen Tsang travelled from the Punjab to the mouth of the Ganges, and made journeys into southern India. But everywhere he found the two religions mingled. Gayá, which holds so high a sanctity in the legends of Buddha, had already become a great Bráhman centre. On the east of Bengal, Assam had never been converted to Buddhism. In the south-west, Orissa was a stronghold of the faith; at the seaport of Tamluk at the mouth of the Húglí (Hooghly), the temples to the Bráhman gods were five times more numerous than the convents of the faithful. On the Madras coast Buddhism flourished; and indeed throughout southern India the faith seems still to have been in the ascendant, although struggling against Bráhman heretics and their gods.

Decline of Buddhism.

During the next two centuries Bráhmanism gradually became the ruling religion. There are legends of persecutions instigated by Bráhman reformers, such as Kumarila Bhatta and Sankar-Achárjya. But the downfall of Buddhism seems to have resulted from natural decay, and from new movements of religious thought, rather than from any general suppression by the sword. Its extinction is contemporaneous with the rise of Hinduism, and belongs to a subsequent part of this sketch. In the 11th century, only outlying states, such as Kashmír and Orissa, remained faithful; and before the Mahometans fairly came upon the scene Buddhism as a popular faith had disappeared from India. During the last ten centuries Buddhism has been a banished religion from its native home. But it has won greater triumphs in its exile than it could ever have achieved in the land of its birth. It has created a literature and a religion for more than a third of the human race, and has profoundly affected the beliefs of the rest. Five hundred millions of men, or 35 per cent. of the inhabitants of the world, still follow the teaching of Buddha. Afghánistán, Nepál, Eastern Turkistán, Tibet, Mongolia, Manchuria, China, Japan, the Eastern Archipelago, Siam, Burmah, Ceylon, and India at one time marked the magnificent circumference of its conquests. Its shrines and monasteries stretched in a continuous line from the Caspian to the Pacific, and still extend from the confines of the Russian empire to the equatorial archipelago. During twenty-four centuries Buddhism has encountered and outlived a series of powerful rivals. At this day it forms one of the three great religions of the world, and is more numerously followed than either Christianity or Islám. In India its influence has survived its separate existence. It not only left behind it a distinct sect, but it supplied a basis upon which Bráhmanism finally developed from the creed of a caste into the religion of the people. This Buddhistic influence on Hinduism will be afterwards noticed. The distinct sect is known as the JAINS (*q.v.*), who number about half a million[2] in India. The noblest survivals of Buddhism in India are to be found, not among any peculiar body, but in the religion of the people; in that principle of the brotherhood of man, with the reassertion of which each new revival of Hinduism starts; in the asylum which the great Hindu sects afford to women who have fallen victims to caste rules, to the widow and the out-caste; in that gentleness and charity to all men, which take the place of a poor-law in India, and give a high significance to the half-satirical epithet of the "mild" Hindu.

Greek-Roman Period.

Gr... inv...

The external history of India commences with the Greek invasion in 327 B.C. Some indirect trade between India and the Levant seems to have existed from very ancient times. Homer was acquainted with tin[3] and other articles of Indian merchandise by their Sanskrit names; and a long list has been made of Indian products mentioned in the Bible.[4] But the first Greek historian who speaks clearly of India was Hecatæus of Miletus (549-486 B.C.); the knowledge of Herodotus (450 B.C.) ended at the Indus; and Ctesias, the physician (401 B.C.), brought back from his residence in Persia only a few facts about the products of India, its dyes and fabrics, monkeys and parrots. India to the east of the Indus was first made known in Europe by the historians and men of science who accompanied Alexander the Great in 327 B.C. Their narratives, although now lost, are condensed in Strabo, Pliny, and Arrian. Soon afterwards Megasthenes, as Greek ambassador resident at a court in the centre of Bengal (306-298 B.C.), had opportunities for the closest observation. The knowledge of the Greeks and Romans concerning India practically dates from his researches, 300 B.C.[5]

Ale... and...

Alexander the Great entered India early in 327 B.C., crossed the Indus above Attock, and advanced, without a struggle, over the intervening territory of the Taxiles[6] to the Jhelum (Hydaspes). He found the Punjab divided into petty kingdoms, jealous of each other, and most of them inclined to join an invader rather than to oppose him. One of these local monarchs, Porus, disputed the passage of the Jhelum, with a force which, substituting guns for chariots, exactly equalled the army of Ranjit Sinh, the ruler of the Punjab in the present century.[7] Plutarch gives a vivid description of the battle from Alexander's own letters. Having drawn up his troops at a bend of the Jhelum, about 14 miles west of the modern field of

[1] *Report of Arch. Survey, Western India, for* 1874-75, p. 83.

[2] Returned by the census of 1872 as 485,020 "Buddhists" in India, besides the 2,447,831 Buddhists in Burmah. Except in a few spots, chiefly among the spurs of the Himálayas and in south-eastern Bengal, the Indian Buddhists may be generally reckoned as Jains.

[3] Greek, *Kassiteros*; Sanskrit, *Kastira*; hence, subsequently, the name of Cassiterides given to the Scilly Islands. *Elephas*, ivory, through the Arabian *eleph* (from Arabic *el*, the, and Sanskrit *ibha*, domestic elephant), is also cited.

[4] Dr Birdwood's *Handbook to the British Indian Section of the Paris Exhibition of* 1878, pp. 20-35.

[5] The fragments of the *Indica* of Megasthenes, collected by Dr Schwanbeck, with the first part of the *Indica* of Arrian, the *Periplus Maris Erythræi*, and Arrian's *Account of the Voyage of Nearchus*, have been translated in two most useful volumes by Mr J. W. M'Crindle, M.A. (Trübner, 1877 and 1879). The *Indica* of Ctesias, with the 15th Book of Strabo, is also promised; and the difficult sections referring to India in Ptolemy's *Geographia*, properly annotated, would complete a work of the highest value to Indian history.

[6] The Takkas, said to be a Turanian race, were the earliest inhabitants of Ráwal Pindí district. They gave their name to the town of Takshásila or Taxila, which Alexander found "a rich and large city, the most populous between the Indus and Hydaspes" (Arrian); it is identified with the ruins of Deri Shahan. Taki or Asarur, on the road between Lahore and Pindí Bhatiyán, was the capital of the Punjab in 633 A.D.

[7] Professor Cowell, who thinks that the Greeks probably exaggerated the numbers of the enemy, judiciously remarks:—"Porus, one of several who occupied the Punjab, is said to have had 200 elephants, 300 chariots, 400 horse, and 30,000 efficient infantry; which, as observed by Sir A. Burnes, is (substituting guns for chariots) exactly the establishment of Ranjit Sinh, who was master of the whole Punjab and several other territories" (Cowell, App. iii. to Elphinstone's *Hist. Ind.*, p. 262, ed. 1866). General Cunningham, who has given a lucid account of the battle, with an excellent map, *Anc. Geog. of India*, pp. 159-177 (ed. 1871), states the army of Alexander at "about 50,000 men, including 5000 auxiliaries under Mophis of Taxila."

Chilianwála,[1] the Macedonian general crossed under shelter of a tempestuous night. The chariots hurried out by Porus stuck in the muddy bank of the river, and in the general engagement which followed his elephants refused to face the Greeks, and, wheeling round, trampled his own army under foot. His son fell early in the onset; Porus himself fled wounded, but, on tendering his submission, was confirmed in his kingdom, and became the conqueror's trusted friend.

Alexander built two memorial cities on the scene of his victory,—Bucephalia on the west bank, near the modern Jalálpur, named after his beloved charger slain in the battle, and Nicæa, the present Mong, on the east side of the river.

Alexander advanced south-east through the kingdom of the younger Porus to Amritsar, and, after a sharp bend backward to the west, to fight the Cathæi at Sangala, he reached the Beas (Hyphasis). There, at a spot not far from the modern battlefield of Sobráon, he halted his victorious standards.[2] He had resolved to march to the Ganges; but his troops were worn out by the heats of the Punjab summer, and their spirits broken by the hurricanes of the south-west monsoon. The native tribes had already risen in his rear, and the conqueror of the world was forced to turn back before he had crossed even the frontier province of India. The Sutlej, the eastern districts of the Punjab, and the mighty Jumna still lay between him and the Ganges. A single defeat might be fatal to his army; if the battle on the Jhelum had not gone in his favour, not a Greek would have reached the Afghán side of the passes. Yielding at length to the clamour of his troops, he led them back to the Jhelum. He there embarked 8000 of them in boats previously prepared, and floated down the river; the remainder of his army marched in two divisions along the banks.

The country was hostile, and the Greeks held only the land on which they encamped. At Múltán (Mooltan), then as now the capital of the southern Punjab, he had to fight a pitched battle with the Malli, and was severely wounded in taking the city. His enraged troops put every soul within it to the sword. Farther down, near the confluence of the five rivers of the Punjab, he made a long halt, built a town,—Alexandria, the modern Uchch,—and received the submission of the neighbouring states. A Greek garrison and satrap, left there by Alexander, laid the foundation of a lasting influence. Having constructed a new fleet suitable for the greater rivers on which he was now to embark, he proceeded southwards through Sind, and followed the course of the Indus until he reached the ocean. In the apex of the delta he founded a city—Patala—which remains to this day under the name of Hyderabad, the capital of Sind.[3] At the mouth of the Indus Alexander beheld for the first time the majestic phenomenon of the tides. One part of his army he shipped off under the command of Nearchus to coast along the Persian Gulf; the other he himself led through southern Baluchistán and Persia to Susa, where, after terrible losses from want of water and famine on the march, he arrived in 325 B.C.

During his two years' campaign in the Punjab and Sind, Alexander captured no province, but he made alliances, founded cities, and planted garrisons. He had transferred much territory to chiefs and confederacies devoted to his cause; every petty court had its Greek faction; and the detachments which he left behind at various positions, from the Afghán frontier to the Beas, and from near the base of the Himálayas to the Sind delta, were visible pledges of his return. At Taxila (Deri-Shahan) and Nicæa (Mong) in the northern Punjab, at Alexandria (Uchch) in the southern Punjab, at Patala (Hyderabad) in Sind, and at other points along his route, he established military settlements of Greeks or allies. A large body of his troops remained in Bactria; and, in the partition of the empire which followed Alexander's death in 323 B.C., Bactria and India eventually fell to Seleucus Nicator, the founder of the Syrian monarchy.

Meanwhile a new power had arisen in India. Among the Indian adventurers who thronged Alexander's camp in the Punjab, each with his plot for winning a kingdom or crushing a rival, Chandra Gupta, an exile from the Gangetic valley, seems to have played a somewhat ignominious part. He tried to tempt the wearied Greeks on the banks of the Beas with schemes of conquest in the rich south-eastern provinces; but, having personally offended their leader, he had to fly the camp (326 B.C.). In the confused years which followed, he managed, with the aid of plundering hordes, to form a kingdom on the ruins of the Nanda dynasty in Magadha, or Behar (316 B.C.).[4] He seized the capital, Pataliputra, the modern Patná, established himself firmly in the Gangetic valley, and compelled the north-western principalities, Greeks and natives alike, to acknowledge his suzerainty.[5] While, therefore, Seleucus was winning his way to the Syrian monarchy during the eleven years which followed Alexander's death, Chandra Gupta was building up an empire in northern India. Seleucus reigned in Syria from 312 to 280 B.C., Chandra Gupta in the Gangetic valley from 316 to 292 B.C. In 312 B.C. the power of both had been consolidated, and the two new sovereignties were soon brought face to face.

Magadha kingdom.

In that year Seleucus, having recovered Babylon, proceeded to re-establish his authority in Bactria and the Punjab. In the latter province he found the Greek influence decayed. Alexander had left behind a mixed force of Greeks and Indians at Taxila. No sooner was he gone than the Indians rose and slew the Greek governor; the Macedonians massacred the Indians; a new governor, sent by Alexander, murdered the friendly Punjab prince, Porus, and was himself driven out of the country by the advance of Chandra Gupta from the Gangetic valley. Seleucus, after a war with Chandra Gupta, determined to ally himself with the new power in India rather than to oppose it. In return for five hundred elephants, he ceded the Greek settlements in the Punjab and the Cabul valley, gave his daughter to Chandra Gupta in marriage, and stationed an ambassador, Megasthenes, at the Gangetic court (*circa* 306–298 B.C.). Chandra Gupta became familiar to the Greeks as Sandrocottus, king of the Prasii; his capital, Pataliputra,[6] or Patná, was rendered into Palibothra. On the other hand, the names of Greeks and kings of Grecian dynasties appear in the rock inscriptions, under Indian forms.[7]

Megasthenes.

Megasthenes has left a life-like picture of the Indian people. Notwithstanding some striking errors, the observations which he jotted down at Patná, three hundred years before Christ, give as

[1] And about thirty miles south-west of Jhelum town.

[2] The change in the course of the Sutlej has altered the old position of that river to the Beas at this point. The best small map of Alexander's route is No. V. in General Cunningham's *Anc. Geog. of India*, p. 104 (ed. 1871)—64 miles to the inch.

[3] For its successive appearances in history, see General Cunningham's *Anc. Geog. of India*, pp. 279-287, under Patala or Nirankot. He gives an excellent map of Alexander's campaign in Sind at p. 248. Patala (Pattala, Pitasila, or Pattale) was formerly identified with Thatha, a town near to where the western arm of the Indus bifurcates (M'Crindle, *Commerce and Navigation of the Erythræan Sea*, p. 156, ed. 1879).

[4] *Corpus Inscriptionum Indicarum*, i. Pref. vii.

[5] For the dynasty of Chandra Gupta see *Numismata Orientalia* (Ceylon fasciculus), pp. 41–50.

[6] The modern Patná, or Pattana, means simply "the city." For its identification with Pataliputrapura and Mr Ravenshaw's crucial discoveries see General Cunningham's *Anc. Geog. India*, p. 452 *seq.*

[7] The Greeks as Yonas (Yavanas) are the Ἰάονες or Ionians. In the 13th edict of Asoka five Greek princes appear: Antiochus (of Syria), Ptolemy (Philadelphus of Egypt), Antigonus (Gonatus of Macedon), Magas (of Cyrene), Alexander (II. of Epirus).

accurate an account of the social organization in the Gangetic valley as any which existed when the Bengal Asiatic Society commenced its labours at the end of the last century (1785). Up to the time of Megasthenes the Greek idea of India was a very vague one. Their historians spoke of two classes of Indians,—certain mountainous tribes who dwelt in northern Afghánistán under the Caucasus or Hindu Kush, and a maritime race living on the coast of Baluchistán. Of the India of modern geography lying beyond the Indus they practically knew nothing. It was this India to the east of the Indus that Megasthenes opened up to the Western world. He describes the classification of the people, dividing them, however, into seven castes instead of four,[1]—namely, philosophers, husbandmen, shepherds, artisans, soldiers, inspectors, and the counsellors of the king. The philosophers were the Bráhmans, and the prescribed stages of their life are indicated. Megasthenes draws a distinction between the Bráhmans (Βραχμᾶνες) and the Sarmanæ (Σαρμάναι), from which some scholars have inferred that the Buddhist Sarmanas were a recognized class fifty years before the council of Asoka. But the Sarmanæ also include Bráhmans in the first and third stages of their life as students and forest recluses.[2] The inspectors[3] or sixth class of Megasthenes have been identified with Asoka's *Mahámátra* and his Buddhist inspectors of morals.

The Greek ambassador observed with admiration the absence of slavery in India, the chastity of the women, and the courage of the men. In valour they excelled all other Asiatics; they required no locks to their doors; above all, no Indian was ever known to tell a lie. Sober and industrious, good farmers, and skilful artisans, they scarcely ever had recourse to a lawsuit, and lived peaceably under their native chiefs. The kingly government is portrayed almost as described in Manu, with its hereditary castes of councillors and soldiers. Megasthenes mentions that India was divided into one hundred and eighteen kingdoms; some of which, such as that of the Prasii under Chandra Gupta, exercised suzerain powers. The village system is well described, each little rural unit seeming to be an independent republic. Megasthenes remarked the exemption of the husbandmen (Vaisyas) from war and public services, and enumerates the dyes, fibres, fabrics, and products (animal, vegetable, and mineral) of India. Husbandry depended on the periodical rains; and forecasts of the weather, with a view to "make adequate provision against a coming deficiency," formed a special duty of the Bráhmans. "The philosopher who errs in his predictions observes silence for the rest of his life."

Before the year 300 B.C. two powerful monarchies had thus begun to act upon the Bráhmanism of northern India, from the east and from the west. On the east, in the Gangetic valley, Chandra Gupta (316–292 B.C.) firmly consolidated the dynasty which during the next century produced Asoka (264–223 B.C.), established Buddhism throughout India, and spread its doctrines from Afghánistán to China, and from Central Asia to Ceylon. On the west, the heritage of Seleucus (312–280 B.C.) diffused Greek influences, and sent forth Græco-Bactrian expeditions to the Punjab. Antiochus Theos (grandson of Seleucus Nicator) and Asoka (grandson of Chandra Gupta), who ruled these two monarchies in the 3d century B.C., made a treaty with each other (256). In the next century Eucratides, king of Bactria, conquered as far as Alexander's royal city of Patala, and possibly sent expeditions into Cutch and Guzerat, 181–161 B.C. Of the Græco-Bactrian monarchs, Menander advanced farthest into North-Western India, and his coins are found from Cabul, near which he probably had his capital, as far as Muttra on the Jumna. The Buddhist dynasty of Chandra Gupta profoundly modified the religion of northern India from the east; the empire of Seleucus, with its Bactrian and later offshoots deeply influenced the science and art of Hindustán from the west.

Græco-Bactrian conquests.

Bráhman astronomy owed much to the Greeks, and what the Buddhists were to the architecture of northern India, that the Greeks were to its sculpture. Greek faces and profiles constantly occur in ancient Buddhist statuary, and enrich almost all the larger museums in India. The purest specimens have been found in the Punjab, where the Ionians settled in greatest force. As we proceed eastward from the Punjab, the Greek type begins to fade. Purity of outline gives place to lusciousness of form. In the female figures, the artists trust more and more to swelling breasts and towering chignons, and load the neck with constantly accumulating jewels. Nevertheless, the Grecian type of countenance long survived in Indian art. It is perfectly unlike the present coarse conventional ideal of sculptured beauty, and may even be traced in the delicate profiles on the so called sun temple at Kanárak, built in the 12th century A.D. on the remote Orissa shore.

Greek influence in art.

It must suffice to indicate the ethnical and dynastic influences thus brought to bear upon India, without attempting to assign dates to the individual monarchs. The chronology of the twelve centuries intervening between the Græco-Bactrian period and the Mahometan conquest still depends on a mass of conflicting evidence derived from inscriptions, legendary literature, unwritten traditions, and coins.[4] Four systems of computation exist, based upon the Vikramáditya, Saka, Seleucidan, and Parthian eras. In the midst of this confusion we see dim masses moving southwards from Central Asia into India. The Græco-Bactrian kings are traced by coins as far as Muttra on the Jumna; and Sanskrit texts have recently revealed their advance through the Middle Land of the Bráhmans (Madhyadesha) to Sáketa (or Ajodhya), the capital of Oudh, and to Patná in Behar.[5] The credentials of the Indian embassy to Augustus in 22–20 B.C. were written on skins,—a circumstance which indicates the extent to which Greek usage had overcome Bráhmanical prejudices. During the century preceding the Christian era Scythian or Tartar hordes began to supplant the Græco-Bactrian influence in the Punjab.

Ethnic influences

Scythic and Non-Aryan Influences.

About 126 B.C. the Tartar tribe of Su is said to have driven out the Greek dynasty from Bactria, and the Græco-Bactrian settlements in the Punjab were overthrown by the Tue-Chi.[6] The Scythian migrations towards India culminated in the empire of Kanishka, who held the fourth Buddhist council, *circa* 40 A.D., and practically became the royal founder of northern Buddhism. The Scythic element played an important part in the history of northern India. Under Kanishka and his successors a connexion was established with the Buddhist nations of central and eastern Asia, traces of which survived to the time of Hwen Tsang (629–645 A.D.) in the name of China-pati, about 10 miles to the west of the Beas river.[7] China-pati is said to have been the town which Kanishka appointed for the residence of his Chinese hostages. It has been suggested that the *Aswamedha*, or great horse sacrifice, in some of its Indian developments at any rate, was based upon Scythic ideas. "It was in effect," writes Mr Edward Thomas, "a martial challenge, which consisted in letting the victim who was to crown the imperial triumph at the year's end go free to wander at will over the face of the earth, its sponsor being bound to follow its hoofs, and to conquer or conciliate" the chiefs through whose territories it passed. Such a prototype seems to him to shadow forth the life of the Central Asia communities of the horseman class, "among

Expulsion of Græco-Bactrian dynasty

Scythians.

whom a steed captured in hostile forays had so frequently to be traced from camp to camp, and surrendered or fought for at last."[1]

An effort has been made to trace Buddha himself to a Scythic origin. He belonged to a royal stock of Sákyas; and the Chinese records supply an intermediate link between his birthplace in Bengal and the supposed home of his race in Central Asia. It is inferred from them that a branch of the Scythian hordes who overran western Asia about 625 B.C. made its way to Patala on the Indus, the site selected by Alexander in 325 B.C. for his head-quarters in that delta, and still the capital of Sind under the name of Hyderabad. One portion of these Patala Scythians went westwards by the Persian Gulf to Assyria; another section eventually moved north-east into the Gangetic valley, and became the Sákyas of Kapilavastu, among whom Buddha was born.[2] His dying command, that he should be buried according to the old custom of his race, and a mound erected over his remains, is opposed to the Indo-Aryan form of obsequies by cremation; but it is essentially in accord with the Scythian mode of disposing of the dead. In the topes or funeral mounds of Buddhism is seen a reproduction of the royal Scythian tombs of which Herodotus speaks.[3] It is therefore argued that the Christian fathers trace back, by no accident, the Manichean doctrine to one "Scythianus," whose disciple Terebinthus took the name of Buddha.[4]

cy-nian ynas-es.

Whatever may be the value of this conjecture, the influence of the Scythian dynasties in northern India is an historical fact. The northern or Tibetan form of Buddhism, represented by Kanishka and his council in 40 A.D., made its way down to the plains of Hindustán, and during the next six centuries competed with the earlier Buddhism of Asoka. The Chinese pilgrim in 629–645 A.D. found both the northern or Scythic and the southern forms of Buddhism in full vigour in India. He spent fourteen months at China-pati, the town where Kanishka had kept his Chinese hostages in the Punjab; and he records the debates between the northern and southern sects of Buddhists in Oudh, Behar, Káthiáwár, and at other places. The Scythic influence in India was a dynastic as well as a religious one. The evidence of coins and the names of Indian tribes of reigning families, such as the Sákas, Huns, and Nágas, point to Scythian settlements as far south as the Central Provinces.[5]

Many scholars believe that the Scythians poured down upon India in such masses as to supplant the previous population. The Jits or Játs,[6] who form nearly one-half of the inhabitants of the Punjab, are identified with the Getæ; their great subdivision the Dhe, with the Dahæ, whom Strabo places on the shores of the Caspian. This view has received the support of most eminent investigators, from Professor H. H. Wilson to General Cunningham, the director-general of the archæological survey.[7] The existing division between the Eastern Játs and the Dhe has, indeed, been traced back to the contiguity of the Massa-getæ or Great Getæ[8] and the Dahæ, who dwelt by the side of each other in Central Asia, and who may have advanced together during the great Scythian movement towards India on the decline of the Bactrian empire. Without pressing such identifications too closely in the service of particular theories, the weight of authority is in favour of a Scythian origin for this most numerous and most industrious section of the population of the Punjab.[9] A similar descent has been assigned to certain of the Rájput tribes. Colonel Tod, still the standard historian of Rájásthán, strongly insisted on this point. Some relationship between the Játs and the Rájputs, although obscure, is acknowledged; and, although the *jus connubii* no longer exists between them, an inscription shows that they intermarried in the 5th century A.D.[10] Professor Cowell, indeed, regarded the arguments for the Scythic descent of the Rájputs as inconclusive.[11] But the whole evidence now collected was not before him; and authorities of great weight have deduced alike from local investigation[12] and from Sanskrit literature[13] a Scythic origin for the Játs, and for some at least of the Rájput tribes. We shall see that the Scythian hordes also supplied certain of the Non-Aryan or so-called aboriginal races of India.

ythian ttle-ments.

The Scythic settlement was not effected without a struggle. As Chandra Gupta advanced from the Gangetic valley, and rolled back the tide of Græco-Bactrian conquest (*circa* 312–306 B.C.), so the Indian heroes of the first century before and after Christ are native princes who stemmed the torrent of Scythian invasion. Vikramáditya, king of Ujjain won his paramount place in Indian story by driving out the invaders. An era, the *Samvat*, beginning in 57 B.C. was founded in honour of his achievements. Its date[14] seems at variance with his legendary victories over the Scythian Kanishka in the first century after Christ;[15] but his very name suffices to commemorate his struggle against the northern hordes as Vikramáditya Sakári, or the enemy of the Scythians. His reign forms the Augustan era of Sanskrit literature; and tradition has ascribed the highest efforts of the Indian intellect during many centuries to the poets and philosophers, or nine gems, of his court. As Chandra Gupta, who freed India from the Greeks, is celebrated in the drama *Mudrá-rákshasa*, so Vikramáditya, the vanquisher of the Scythians, forms the central royal personage of the Hindu stage.

Expulsion o Scy-thians

Vikramáditya's achievements, however, formed no final deliverance, but merely an episode in a long struggle between the Indian dynasties and new races from the north. Another popular era, the *Saka* (literally the

[13] Dr Fitz-Edward Hall's edition of Professor H. H. Wilson's *Vishnu Purána*, vol. ii. p. 134. The Húnas, according to Wilson, were "the White Huns, who were established in the Punjab and along the Indus, as we know from Arrian, Strabo, and Ptolemy, confirmed by recent discoveries of their coins and by inscriptions." "I am not prepared," says Dr Fitz-Edward Hall, "to deny that the ancient Hindus when they spoke of the Húnas included the Huns. In the Middle Ages, however, it is certain that a race called Húna was understood by the learned of India to form a division of the Kshattriyas."—Professor Dowson's *Dict. Hind. Mythology*, &c., p. 122.

[14] *Samvatsara*, "the year." The uncertainty which surrounds even this long accepted finger-post in Indian chronology may be seen from Dr J. Fergusson's paper "On the Sáka and Samvat and Gupta Eras," *Journal Roy. As. Soc.*, new series, vol. xii., especially p. 172.

[15] The Hushka, Jushka, and Kanishka family of the Rájá Tarangini, or chronicles of Kashmír, are proved by inscriptions to belong to the 4th century of the Seleucidan era, or the 1st century A.D.

Scythian), takes its commencement in 78 A.D.,[1] and is supposed to commemorate the defeat of the Scythians by a king of southern India, Saliváhana.[2] During the seven centuries which followed, three powerful monarchies, the Sáhs, Guptas, and Valabhís, established themselves in northern and western India. The Sáhs of Suráshtra are traced by coins and inscriptions from 60 or 70 B.C. to after 235 A.D.[3] After the Sáhs come the Guptas of Kanauj,[4] in the North-Western Provinces, the Middle Land (Madhyadesha) of ancient Bráhmanism. The Guptas introduced an era of their own, commencing in 319 B.C., and ruled in person or by viceroys over northern India during one hundred and fifty years, as far to the south-west as Káthiáwár. The Gupta dynasty was overthrown by foreign invaders, apparently a new influx of Huns or Tartars from the north-west (450–470 A.D.). The Valabhís succeeded the Guptas, and ruled over Cutch, the north-western districts of Bombay[5] and Málwá, from 480 to after 722 A.D.[6] The Chinese pilgrim gives a full account of the court and people of Valabhí (630–640 A.D.). Buddhism was the state religion, but heretics (Bráhmans) abounded; and the Buddhists themselves were divided between the northern school of the Scythian dynasties and the southern or Indian school of Asoka. The Valabhís seem to have been overthrown by the early Arab invaders of Sind in the 8th century.

Early Indian dynasties.

The relations of these three Indian dynasties, the Sáhs, Guptas, and Valabhís, to the successive hordes of Scythians who poured down on northern India are obscure. There is abundant evidence of a long-continued struggle, but the attempt to assign dates to its chief episodes has not yet produced results which can be accepted as final. Two Vikramáditya Sakáris, or vanquishers of the Scythians, are required for the purposes of chronology; and the great battle of Korúr, near Múltán, at which the Scythian hosts perished, has been shifted backwards and forwards from 78 to 544 A.D.[7] The truth seems to be that, during the first six centuries of the Christian era, the fortunes of the Scythian or Tartar races rose and fell from time to time in northern India. They more than once sustained great defeats; and they more than once overthrew the native dynasties. Their presence is abundantly attested during the century before Christ, represented by Vikramáditya (57 B.C.); during the first century after Christ, represented by the Kanishka family (2 B.C. to 87 A.D.); and thence to the time of Cosmas Indicopleustes, about 535 A.D. The latest writer on the subject[8] believes that it was the White Huns who overthrew the Guptas between 465 and 470 A.D. He places the great battles of Korúr and Maushari, which "freed India from the Sákas and Húnas," between 524 and 544 A.D. Cosmas Indicopleustes, who traded in the Red Sea about 535 A.D., speaks of the Huns as a powerful nation in northern India in his days.[9]

Non-Aryan dynasties.

While Greek and Scythic influences had thus been at work in northern India during nine centuries (327 B.C. to 544 A.D.), another element was profoundly affecting the future of the Indian people. In a previous section we have traced the fortunes, and sketched the present condition, of the non-Aryan "aborigines." The Bráhmanical Aryans never effected anything like a complete subjugation of these earlier races. The tribes and castes of non-Aryan origin still number about 18 millions in British territory; the castes who claim a pure Aryan descent are under 17 millions. The non-Aryans have influenced the popular dialects of almost every province, and in southern India have given their speech to 46 millions of people. The Vedic settlements along the five rivers of the Punjab were merely colonies or confederacies of Aryan tribes, who had pushed in among a non-Aryan population. When an Aryan family advanced to a new territory, it had often, as in the case of the Pándava brethren, to clear the forest and drive out the aboriginal people. This double process constantly repeated itself, and so late as 1657 A.D., when the Hindu rájá founded the present city of Bareilly, his first work was to cut down the jungle and expel the Katheriyas. The ancient Bráhmanical kingdoms of the Middle Land, or Madhyadesha, in the North-Western Provinces and Oudh, were surrounded by non-Aryan peoples. All the legendary advances beyond the centre of Aryan civilization, narrated in the epic poets, were made into the territory of non-Aryan races. When we begin to catch historic glimpses of India, we find the most powerful kingdoms ruled by non-Aryan princes. Thus the Nandas, whom Chandra Gupta succeeded in Behar, were a Súdra or non-Aryan dynasty; and, according to one account, Chandra Gupta and his grandson Asoka came of the same stock.[10]

The Buddhist religion did much to incorporate the non-Aryan tribes into the Indian polity. During the long struggle against Græco-Bactrian and Scythian inroads (327 B.C. to 544 A.D.), the Indian aboriginal races must have had an ever-increasing importance, whether as enemies or allies. At the end of that struggle we discover them in some of the fairest tracts of northern India. In almost every district throughout Oudh and the North-Western Provinces ruined towns and forts are ascribed to aboriginal races who ruled at different periods, according to the local legends, between the 5th and 11th centuries A.D. When the Mahometan conquest supplies an historical footing after 1000 A.D., non-Aryan races were in possession of some of these districts, and had been lately ousted from others.

The statistical survey has brought to light many traces of these obscure peoples. It would be impossible to follow that survey through each locality; but we propose, with the utmost brevity, to indicate a few of the results. Starting from the west, Alexander the Great found Ráwal Pindí district in the hands of the Takkas or Takshaks, from whom its Greek name of Taxila was derived. This people has been traced to a Scythian migration about the 6th century B.C.[11] Their settlements in the 4th century B.C. seem to have extended from the Paropamisan range[12] in Afghánistán deep into northern India. Their Punjab capital, Takshásila or Taxila, was the largest city that Alexander found between the Indus and the Jhelum (327

[10] The *Mudrá-rákshasa* represents Chandra Gupta as related to the last of the Nandas; the commentator on the *Vishnu Purána* says he was the son of a Nanda by a low-caste woman. Professor Dowson's *Dict. Hindu Mythology*, &c., p. 68 (Trübner, 1879).

[11] Such dates have no pretension to be anything more than intelligent conjectures based on very inadequate evidence. With regard to the Takshaks, see Colonel Tod and the authorities which he quotes, *Rájásthán*, vol. i. 53 *passim*; 93 *seq.* (Madras reprint, 1873).

[12] Where Alexander found them as the Paræ-tacæ—*pahári*, or Hill Tacæ (?).

B.C.).[1] Saliháváua, from whom the Sáka or Scythian era took its commencement (78 A.D.), is held by some authorities to have been a Takshak.[2] In the 7th century A.D. Taki,[3] perhaps derived from the same race, was the capital of the Punjab. The Scythic Takshaks are supposed to have been the source of the great serpent race, the Takshaks or Nágás, who figure so prominently in Sanskrit literature and art, and whose name is still retained by the Nágá tribes of our own day. The words Nágá and Takshak in Sanskrit both mean "a snake," or mythological tailed monster. The Takshaks are identified with the Scythian Takkas, and the Nágás have been connected with the Tartar patriarch Nagas, the second son of El-khán.[4] The two names, however, seem to have been applied by the Sanskrit writers to a variety of non-Aryan peoples in India, whose religion was of an anti-Aryan type. We learn, for example, how the four Pándu brethren of the Mahábhárata turned out the snake-king Takshaka from his primæval Khándava forest. The Takshaks and Nágás were the tree and serpent worshippers, whose rites and objects of adoration have impressed themselves so deeply on the architecture and sculpture of India. The names were applied in a confused manner to different races of Scythic origin; and the greatest authority on tree and serpent worship in India has deliberately selected the term "Scythian" for the anti-Aryan elements which entered so largely into the Indian religions both in ancient and modern times.[5] The Chinese records give a full account of the Nágá geography of ancient India. They enumerate numerous and powerful Nágá kingdoms, from which Buddhism derived many of its converts. The Chinese chroniclers, indeed, classify the Nágá princes of India into two great divisions, as Buddhists and non-Buddhists. The serpent worship which formed so typical a characteristic of the Indo-Scythic races led the Chinese to confound them with the objects of their adoration; and the Indian Nágás and their rites seem to have supplied the Dragon races of Chinese Buddhism and of religious and secular art in China.

As the Greek invaders found Ráwal Pindí district in possession of a Scythic race of Takkas in 327 B.C., so the Musalmán conqueror found it inhabited by a fierce non-Aryan race of Ghakkars thirteen hundred years later. The Ghakkars for a time imperilled the safety of Mahmúd of Ghazní in 1008 A.D. Ferishta describes them as savages addicted to polyandry and infanticide. The tide of Mahometan conquest rolled on, but the Ghakkars remained in possession of their submontane tract. In 1205 they slew the second Mahometan conquerer of India, Muhammad Ghori, in his tent, and ravaged the Punjab to the gates of Lahore; and, in spite of conversion to Islám by the sword, it was not till 1525 that they made their submission to Bábar in return for a grant of country. During the next two centuries they rendered great services to the Mughal dynasty against the Afghán usurpers, and rose to high influence in the Punjab. Driven from the plains by the Síkhs in 1765, the Ghakkar chiefs maintained their independence in the Murree (Marri) Hills till 1830, when they were crushed after a bloody struggle. In 1849 Ráwal Pindí passed, with the rest of the Síkh territories, under British rule. But the Ghakkars revolted four years afterwards, and threatened Murree, the summer capital of the Punjab, so late as 1857. They now number only 10,153 persons, described by the British officers as "a fine spirited race, gentlemen in ancestry and bearing, and clinging under all reverses to the traditions of noble blood."

We have selected the inhabitants of Ráwal Pindí district to illustrate the long-continued presence and vitality of the non-Aryan races in India. We shall deal more briefly with other parts of the country. Proceeding inwards to the North-Western Provinces, we find traces of an early Buddhist civilization having been overturned by rude non-Aryan races. In Bareilly district, for example, the wild Ahírs from the north, the Bhíls from the south, and the Bhars from the west seem to have expelled highly developed Aryan communities not long before 1000 A.D. Still farther to the east, all remains of prehistoric masonry in Oudh and the North-Western Provinces are assigned either to the ancient Buddhists or to a mediæval race of Bhars. The Bhars appear to have possessed the north Gangetic plains in the centuries coeval with the fall of Buddhism. Their kingdoms extended over most of Oudh, and lofty mounds covered with ancient groves still mark the sites of their forgotten cities. They are the mysterious "fort-builders" to whom the peasantry ascribe any ruin of unusual size. In the western districts their power is said to have been crushed by the Sharki dynasty of Jaunpur in the end of the 14th century. In the eastern districts of the north Gangetic plain, the Bhars figure still more prominently in local traditions, and an attempt has been made to trace their continuous history. In Gorakhpur district a movement of aboriginal Tharus and Bhars seems to have overwhelmed the early outposts of Aryan civilization several centuries before Christ. They afterwards became vassals of the Buddhist kingdom of Behar on the south-east, and on the fall of that power, about 550, the Bhars regained their independence. The Chinese pilgrim in the 7th century comments on the large number of monasteries and towers in this region—the latter probably monuments of the struggle with the aboriginal Bhars, who were there finally crushed between the 7th and 10th centuries.

As we advance still farther eastwards into Bengal, we find that the non-Aryan races have within historical time supplied a large part of the Hindu population. In the north the Koch established their dominion upon the ruins of the Aryan kingdom of Kámrúp, which the Afghán king of Bengal had overthrown in 1489. The Koch gave their name to the native state of Kuch (Cooch) Behar, and their descendants, together with those of other non-Aryan tribes, form the mass of the people in the neighbouring British districts. Some eluded the effects of their low origin by becoming Musalmáns, and thus obtained that social equality which Islám grants to all mankind. The rest have merged more or less into the Hindu population; but masses of them claim, in virtue of their position as an old dominant race, to belong to the Kshattriya caste. They call themselves Rájbansís, a term exactly corresponding to the Rájputs of western India. The rájás of Kuch Behar lay claim to a divine origin, in order to conceal their aboriginal descent; and all remembrance of the Koch tribe is carefully avoided at court.

Proceeding still eastwards, we enter the adjacent valley of Assam, until last century the seat of another non-Aryan ruling race. The Ahams entered Assam from the south-east about 1350 (?), had firmly established their power by 1663, gradually yielded to Hinduism, and were overpowered by fresh invasions from Burmah between 1750 and 1820, when the valley was annexed to British India.

Bhils. Bhars. Koch. Ahams.

---

[1] Arrian. The Bráhman mythologists, of course, found an Aryan pedigree for so important a person as King Taksha, and make him the son of Bharata, and nephew of Ráma-chandra!

[2] Tod, *Rájásthán*, i. 95 (ed. 1873).

[3] Taki, or Asarur, 45 miles west of Lahore. General Cunningham, *Anc. Geog. Ind.*, p. 191, and map vi. (ed. 1871). This Taki lies considerably to the south-east of the Takshásila of Alexander's expedition.

[4] Tod, *Rájásthán*, i. 53 (ed. 1873).

[5] Dr J. Fergusson's *Tree and Serpent Worship*, p. 71-72. (India Museum, 4to, 1868). For the results of more recent local research, see Mr Rivett-Carnac's papers in the *Journ. of the As. Soc., Bengal*, "The Snake Symbol in India," "Ancient Sculpturings on Rocks," "Stone Carvings at Mainpuri," &c.; and the Hon. Ráo Sáhib Vishvanáks Náráyan Mandlik's "Serpent Worship in Western India," and other essays, in the *Bombay As. Soc. Journal*.

By the Burmese the Ahams have been completely crushed as a dominant race, and their national priests, to the number of 179,000, have been forced to till the soil to gain their living. But the people of Assam are still so essentially made up of aboriginal races and their Hinduized descendants that not 65,000 persons of even alleged pure Aryan descent can be found in a population exceeding 4 millions.

Non-Aryans south of the Ganges.

We have hitherto confined our survey to the country on the north of the Ganges. If we pass to the southern Gangetic plain, we find that almost every tract has traditions of a non-Aryan tribe, either as a once dominant race or as lying at the root of the local population. The great division of Bundelkhand contains several crushed peoples of this class, and takes its name from the Bundelas, a tribe of at least semi-aboriginal descent. As we rise from the Gangetic plain into the highlands of the Central Provinces, we reach the abiding home of the non-Aryan tribes. One such race after another—Gaulís, Nágás, Gonds, Ahírs—ruled from the Sátpura plateau. If we turn to the lower provinces of Bengal we find the delta peopled by masses of non-Aryan origin. One section of them has merged into low-caste Hindus; another section has sought a more equal social organization by accepting the creed of Mahomet. But such changes of faith do not alter their ethnical type; and the Musalmán of the delta differs as widely in race from the Afghán as the low-caste Hindu of the delta differs from the Bráhman. Throughout southern India the non-Aryan elements make up almost the entire population, and have supplied the great Dravidian family of languages, spoken by 46 millions of people.

Mahometan Period.

At the very time that Buddhism was being crushed out of India by the Bráhmanic reaction, a new faith was being born in Arabia, destined to supply a youthful fanaticism which should sweep the country from the Himálayas to Cape Comorin, and from the western to the eastern sea. Muhammad, commonly known as Mahomet, the founder of Islám, died at Medina in 632 A.D., while the Chinese pilgrim Hwen Tsang was still on his travels. The first Mahometan invasion of India is placed in 664, only thirty-two years after the death of the prophet. The Punjab is said to have been ravaged on this occasion with no permanent results. The first Mahometan conquest was the outlying province of Sind, which from the point of view of geology may be regarded as a continuation of the desert of Baluchistán. In 711, or seventy-nine years after the death of Mahomet, an Arab army under Muhammad Kásim invaded and conquered the Hindus of Sind in the name of Walid I., caliph of Damascus, of the Bene-Umyyeh line. In the same year Roderic, the last of the Goths, fell before the victorious Saracens in Spain. But in India the bravery of the Rájputs and the devotion of the Bráhmans seem to have afforded a stronger national bulwark than existed in western Europe. In 750 the Hindus rose in rebellion and drove out the Musalmán tyrant, and the land had rest for one hundred and fifty years.

Mahometan invasions.

Mahmúd of Ghazní.

The next Mahometan invasion of India is associated with the name of Sultán Mahmúd of Ghazní. Mahmúd was the eldest son of Sabuktagín, surnamed Nasr-ud-dín, in origin a Turkish slave, who had established his rule over the greater part of modern Afghánistán and Khorasán with Ghazní as his capital. In 977 Sabuktagín is said to have defeated Jáipal, the Hindu rájá of Lahore, and to have rendered the Punjab tributary. But his son Mahmúd was the first of the great Musalmán conquerors whose names still ring through Asia. Mahmúd succeeded to the throne in 997. During his reign of thirty-three years he extended the limits of his father's kingdom from Persia on the east to the Ganges on the west; and it is related that he led his armies into the plains of India no less than seventeen times. In 1001 he defeated Rájá Jáipal a second time, and took him prisoner. But Anandpal, the son of Jáipal, raised again the standard of national independence, and gathered an army of Rájput allies from the furthest corners of Hindustán. The decisive battle was fought in the valley of Peshâwar. Mahmúd won the day by the aid of his Turkish horsemen, and thenceforth the Punjab has been a Mahometan province, except during the brief period of Síkh supremacy. The most famous of Mahmúd's invasions of India was that undertaken in 1024 against Guzerat. The goal of this expedition was the temple dedicated to Siva at Somnáth, around which so many legends have gathered. It is reported that Mahmúd marched through Ajmír, to avoid the desert of Sind; that he found the Hindus gathered on the neck of the peninsula of Somnáth in defence of their holy city; that the battle lasted for two days; that in the end the Rájput warriors fled to their boats, while the Bráhman priests retired into the inmost shrine; that Mahmúd, introduced into this shrine, rejected all entreaties by the Bráhmans to spare their idol, and all offers of ransom; that he smote the image with his club, and forthwith a fountain of precious stones gushed out. Until the British invasion of Afghánistán in 1839, the club of Mahmúd and the sandal-wood gates of Somnáth were preserved at the tomb of the great conqueror near Ghazní. The club has now disappeared, and the gates carried back to India by General Nott are recognized to be a clumsy forgery. To Mahometans Mahmúd is known, not only as a champion of the faith, but as a munificent patron of literature. The dynasty that he founded was not long-lived. Fourteen of his descendants occupied his throne within little more than a century, but none of them achieved greatness. A blood-feud arose between them and a line of Afghán princes who had established themselves among the mountains of Ghor. In 1152 Bahrám, the last of the Ghaznivide Turks, was overthrown by Allah-ud-dín of Ghor, and the wealthy and populous city of Ghazní was razed to the ground. But even the Ghoride conqueror spared the tomb of Mahmúd.

Khusru, the son of Bahrám, fled to Lahore, and there established the first Mahometan dynasty within India. It speedily ended with his son, also called Khusru, whom Muhammad Ghori, the relentless enemy of the Ghaznivide house, carried away into captivity in 1186.

The Afgháns of Ghor or Ghur thus rose to power on the downfall of the Turks of Ghazní. The founder of the family is said to have been Izzud-dín al Husáin, whose son Allah-ud-dín destroyed Ghazní, as already mentioned. Allah-ud-dín had two nephews, Ghíyás-ud-dín and Muiz-ud-dín, the latter of whom, also called Shahab-ud-dín by Musalmán chroniclers, and generally known in history as Muhammad Ghori, is the second of the great Mahometan conquerors of India. In 1176 he took Múltán and Uchch; in 1187 Lahore fell into his hands; in 1191 he was repulsed before Delhi, but soon afterwards he redeemed this disaster. Hindustán Proper was at that period divided between the two Rájput kingdoms of Kanauj and Delhi. Muhammad Ghori achieved his object by playing off the rival kings against each other. By 1193 he had extended his conquests as far east as Benares, and the defeated Rájputs migrated in a body to the hills and deserts now known as Rájputána. In 1199 one of his lieutenants, named Bakhtiyar, advanced into Bengal, and expelled by an audacious stratagem the last Hindu rájá of Nadiyá. The entire northern plain, from the Indus to the Brahmaputra, thus lay under the Mahometan yoke. But Muhammad Ghori never settled himself permanently in India. His favourite residence is said to have been the old capital of Ghazní, while he governed his Indian conquests through the agency of a favourite slave, Kutab-ud-dín. Muhammad Ghori died in 1206, being assassinated by some Ghakkar tribesmen while sleeping in his tent by the bank of the Indus; on his death both Ghor and Ghazní drop out of history, and Delhi first appears as the Mahometan capital of India.

On the death of Muhammad Ghori, Kutab-ud-dín at once laid aside the title of viceroy, and proclaimed himself sultán of Delhi. He was the founder of what is known as the slave dynasty, which lasted for nearly a century (1206–1288). The name of Kutab is preserved in the *minar*, or pillar of victory, which still stands amid the ruins of ancient Delhi, towering high above all later structures. Kutab himself is said to have been successful as a general and an administrator, but none of his successors has left a mark in history.

...e ...nasty.

...lh- ...lín.

In 1294 Allah-ud-dín Khiljí, the third of the great Mahometan conquerors of India, raised himself to the throne of Delhi by the treacherous assassination of his uncle Firoz II., who had himself supplanted the last of the slave dynasty. Allah-ud-dín had already won military renown by his expeditions into the yet unsubdued south. He had plundered the temples at Bhílsa in central India, which are admired to the present day as the most interesting examples of Buddhist architecture in the country. At the head of a small band of horsemen, he had ridden as far south as Deogiri in the Deccan, and plundered the Marhattá capital. When once established as sultán, he planned more extensive schemes of conquest. One army was sent to Guzerat under Alaf Khán, who conquered and expelled the last Rájput king of Anhalwár or Pátan. Another army, led by the sultán in person, marched into the heart of Rájputána, and stormed the rock-fortress of Chitor, where the Rájputs had taken refuge with their women and children. A third army, commanded by Malik Kafúr, a Hindu renegade and favourite of Allah-ud-dín, penetrated to the extreme south of the peninsula, scattering the unwarlike Dravidian races, and stripping every Hindu temple of its accumulations of gold and jewels. To this day the name of Malik Kafúr is remembered in the remote district of Madura, in association with irresistible fate and every form of sacrilege.

Allah-ud-dín died in 1316, having subjected to Islám the Deccan and Guzerat. Three of his descendants followed him upon the throne, but their united reigns extended over only five years. In 1321 a successful revolt was headed by Ghiyas-ud-dín Tughlak, governor of the Punjab, who is said to have been of Turkish origin. The Tughlak dynasty lasted for about seventy years, until it was swept away by the invasion of Timúr, the fourth Mahometan conqueror of India, in 1398. Ghiyas-ud-dín, the founder of the line, is only known for having removed the capital from Delhi to a spot about 4 miles further to the east, which he called Tughlakábád. His son and successor, Muhammad Tughlak, who reigned from 1325 to 1351, is described by Elphinstone as "one of the most accomplished princes and one of the most furious tyrants that ever adorned or disgraced human nature." He wasted the treasure accumulated by Allah-ud-dín in purchasing the retirement of the Mughal hordes, who had already made their appearance in the Punjab. When the internal circulation failed, he issued a forced currency of copper, which is said to have deranged the whole commerce of the country At one time he raised an army for the invasion of Persia. At another he actually despatched an expedition against China, which perished miserably in the Himálayan passes. When Hindustán was thus suffering from his misgovernment, he conceived the project of transferring the seat of empire to the Deccan, and compelled the inhabitants of Delhi to remove a distance of 700 miles to Deogiri or Daulatábád. And yet during the reign of this sultán both the Tughlak dynasty and the city of Delhi are said to have attained their utmost growth. Muhammad was succeeded by his cousin Firoz, who likewise was not content without a new capital, which he placed a few miles north of Delhi, and called after his own name. Meanwhile the remote provinces of the empire began to throw off their allegiance to the sultáns of Delhi. The independence of the Afghán kings of Bengal is generally dated from 1336, when Muhammad Tughlak was yet on the throne. The commencement of the reign of Allah-ud-dín, the founder of the Báhmani dynasty in the Deccan, is variously assigned to 1347 and 1357. Zafar Khán, the first of the Ahmadábád kings, acted as an independent ruler from the time of his first appointment as governor of Guzerat in 1391. These and other revolts prepared the way for the fourth great invasion of India under Timúr (Tamerlane).

...ham- ...d ...ghlak.

Timúr's invasion

Accordingly, when Timúr invaded India in 1398, he encountered but little organized resistance. Mahmúd, the last of the Tughlak dynasty, being defeated in a battle outside the walls of Delhi, fled into Guzerat. The city was sacked and the inhabitants massacred by the victorious Mughals. But the invasion of Timúr left no permanent impress upon the history of India, except in so far as its memory fired the imagination of Bábar (Baber), the founder of the Mughal dynasty. The details of the fighting and of the atrocities may be found related in cold blood by Timúr himself in the *Malfuzat-i-Timúri*, which has been translated in Elliot's *History of India as told by its own Historians*, vol. iii. Timúr marched back to Samarkand as he had come, by way of Cabul, and Mahmúd Tughlak ventured to return to his desolate capital. He was succeeded by what is known as the Sayyid dynasty, which held Delhi and a few miles of surrounding country for about forty years. The Sayyids were in their turn expelled by Beloli, an Afghán of the Lodi tribe, whose successors removed the seat of government to Agra, which thus for the first time became the imperial city. In 1525 Bábar (Baber), the fifth in descent from Timúr, and also the fifth Mahometan conqueror, invaded India at the instigation of the governor of the Punjab, won the victory of Pánipat over Ibráhim, the last of the Lodi dynasty, and founded the Mughal empire, which lasted, at least in name, until 1857.

Dynast... of south... ern Ind...

Before entering upon the story of the Mughal empire, it is desirable to give a short sketch of the condition of southern India at this period, which marks a turning point in Indian history. The earliest local traditions agree in dividing the extreme south into four provinces, Kerala, Pandya, Chola, and Chera, which together made up the country of Dravida, occupied by Tamil-speaking races. Of these kingdoms the greatest was that of Pandya, with its capital of Madura, the foundation of which is assigned on high authority to the 4th century B.C. Other early southern cities whose sites can be identified are Combaconum and Tanjore, the successive capitals of the Chola kingdom, and Talkad in Mysore, now buried by the sands of the Káveri (Cauvery), the capital of the Chera kingdom. The local *Purana*, or chronicle of Madura, gives a list of two Pandyan dynasties, the first of which has seventy-three kings, the second forty-three. Parakrama, the last king of the second dynasty, was overthrown by the Mahometan invader, Málik Kafúr, in 1324; but the Musalmáns never established their power in the extreme south, and a series of Hindu lines ruled at Madura into the 18th century. No other Dravidian kingdom can boast such a continuous succession as that of Madura. The chronicles enumerate fifty Chera kings, and no less than sixty-six Chola kings, as well as many minor dynasties which ruled at various periods over fractions of the south. Little confidence, however, can be placed in Hindu genealogies, and the early history of the Dravidian races yet remains to be deciphered from mouldering palm leaves and the more trustworthy inscriptions on copper and stone. Authentic history begins with the Hindu empire of Vijayanagar or Narsingha, which exercised an ill-defined sovereignty over the entire south from the 12th to the 16th century. The foundation of the city of Vijayanagar is assigned to the year 1118, and to an eponymous hero, Rájá Vijaya, the fifth of his line. Its extensive ruins are still to be traced on the right bank of the Tungabhadra river within the Madras district of Bellary. The city itself has not been inhabited since it was sacked by the Mahometans in 1565, but vast remains still exist of temples, fortifications, tanks, and bridges, haunted by beasts of prey and venomous reptiles. The empire of Vijayanagar represents the last stand made by the national faith in India against conquering Islam. For at least three centuries its sway over the south was undisputed, and its rájás waged wars and concluded treaties of peace with the sultáns of the Deccan on equal terms.

Mahometan dynasties in Deccan.

The earliest of the Mahometan dynasties in the Deccan was that founded by Allah-ud-dín in 1347 or 1357, which has received the name of the Báhmani dynasty from the supposed Bráhman descent of its founder. The capital was first at Gulbargah, and was afterwards removed to Bidar, both which places still possess magnificent palaces and mosques in ruins. Towards the close of the 14th century the Báhmani empire fell to pieces, and five independent kingdoms divided the Deccan among them. These were—(1) the Adíl Sháhi dynasty, with its capital at Bijapur, founded in 1489 by a son of Amurath II., sultán of the Ottomans; (2) the Kutab Sháhi dynasty, with its capital at Golconda, founded in 1512 by a Turkoman adventurer; (3) the Nizám Sháhi dynasty, with its capital at Ahmadnagar, founded in 1490 by a Bráhman renegade, from the Vijayanagar court; (4) the Ímad Sháhi dynasty of Berar, with its capital at Ellichpur, founded in 1484 also by a Hindu from Vijayanagar; (5) the Barid Sháhi dynasty, with its capital at Bidar, founded about 1492 by one who is variously described as a Turk and a Georgian slave. It is, of course, impossible here to trace in detail the history of these several dynasties. In 1565 they combined against the Hindu rájá of Vijayanagar, who was defeated and slain in the decisive battle of Talikota. But, though the city was sacked and the supremacy of Vijayanagar for ever destroyed, the Mahometan victors did not themselves advance into the south. The Naiks or feudatories of Vijayanagar everywhere asserted their independence. From them are descended the well-known Pálegárs of the south, and also the present rájá of Mysore. One of the blood-royal of Vijayanagar fled to Chandragiri, and founded a line which exercised a prerogative of its former sovereignty by granting the site of Madras to the English in 1639. Another scion claiming the same high descent lingers to the present day near the ruins of Vijayanagar, and is known as the rájá of Anagundi, a feudatory of the nizám of Hyderabad. Despite frequent internal strife, the sultáns of the Deccan retained their independence until conquered by the Mughal emperor Aurangzeb in the latter half of the 17th century. To complete this sketch of India at the time of Bábar's invasion it remains to say that an independent Mahometan dynasty reigned at Ahmadábád in Guzerat for nearly two centuries (from 1391 to 1573), until conquered by Akbar; and that Bengal was similarly independent, under a line of Afghán kings, with Gaur for their capital, from 1336 to 1573. When, therefore, Bábar invaded India in 1525, the greater part of the country was Mahometan, but it did not recognize the authority of the Afghán sultan of the Lodi dynasty, who resided at Agra, and also ruled the historical capital of Delhi. After having won the battle of Pánipat, Bábar was no more acknowledged as emperor of India than his ancestor Timúr had been. Bábar, however, unlike Timúr, had resolved to settle in the plains of Hindustán, and carve out for himself a new empire with the help of his Mughal followers. His first task was to repel an attack by the Rájputs of Chitor, who seem to have attempted to re-establish at this time a Hindu empire. The battle was fought at Sikri near Agra, and is memorable for the vow made by the easy living Bábar that he would never again touch wine. Bábar was again victorious, but died shortly afterwards in 1530. He was succeeded by his son Humáyún, who is chiefly known as being the father of Akbar. In Humáyún's reign the subject Afgháns rose in revolt under Sher Sháh, a native of Bengal, who for a short time established his authority over all Hindustán. Humáyún was driven as an exile into Persia; and, while he was flying through the desert of Sind, his son Akbar was born to him in the petty fortress of Umarkot. But Sher Sháh was killed at the storming of the rock-fortress of Kálinjar, and Humáyún, after many vicissitudes, succeeded in re-establishing his authority at Lahore and Delhi.

Mughal dynasty.

Af... rev...

Humáyún died by an accident in 1556, leaving but a circumscribed kingdom, surrounded on every side by active foes, to his son Akbar, then a boy of only fourteen years. Akbar the Great, the real founder of the Mughal empire as it existed for two centuries, was the contemporary of our own Queen Elizabeth (1558-1603). He was born in 1542, and his reign lasted from 1556 to 1605. When his father died he was absent in the Punjab, fighting the revolted Afgháns, under the guardianship of Bairám Khán, a native of Badakshán, whose military skill largely contributed to recover the throne for the Mughal line. For the first seven years of his reign Akbar was perpetually engaged in warfare. His first task was to establish his authority in the Punjab, and in the country around Delhi and Agra. In 1568 he stormed the Rájput stronghold of Chitor, and conquered Ajmír. In 1570 he obtained possession of Oudh and Gwalior. In 1572 he marched in person into Guzerat, defeated the last of the independent sultáns of Ahmadábád, and formed the province into a Mughal viceroyalty or subah. In the same year his generals drove out the Afgháns from Bengal, and reunited the lower valley of the Ganges to Hindustán. Akbar was then the undisputed ruler of a larger portion of India than had ever before acknowledged the sway of one man. But he continued to extend his conquests throughout his lifetime. In 1578 Orissa was annexed to Bengal by his Hindu general Todar Mall, who forthwith organized a revenue survey of the whole province. Cabul submitted in 1581, Kashmír in 1586, Sind in 1592, and Kandahár in 1594. At last he turned his arms against the Mahometan kings of the Deccan, and wrested from them Berar; but the permanent conquest of the south was reserved for Aurangzeb.

Al...

If the history of Akbar were confined to this long list of conquests, his name would on their account alone find a high place among those which mankind delights to remember. But it is as a civil administrator that his reputation is cherished in India to the present day. With regard to the land revenue, the essence of his procedure was to fix the amount which the cultivators should pay at one-third of the gross produce, leaving it to their option to pay in money or in kind. The total land revenue received by Akbar amounted to about $16\frac{1}{2}$ millions sterling. Comparing the area of his empire with the corresponding area now under the British, it has been calculated that Akbar, three hundred years ago, obtained $15\frac{1}{2}$ millions where they obtain only $13\frac{1}{2}$ millions,—an amount representing not more than one-half the purchasing power of Akbar's $15\frac{1}{2}$ millions. The distinction between *khálsa* land, or the imperial demesne, and *jagír* lands, granted revenue free or at quit rent in reward for services, also dates from the time of Akbar. As regards his military system, Akbar invented a sort of feudal organization, by which every tributary rájá took his place by the side of his own Mughal nobles. In theory it was an aristocracy based only upon military command; but practically it accomplished the object at which it aimed by incorporating the hereditary chiefships of Rájputána among the mushroom creations of a Mahometan despotism. Musalmáns and Hindus were alike known only as *mansabdárs* or commanders of so many horse, the highest title being that of *amír* (ameer), corrupted by European travellers into *umrah* or *omrah*. The third and last of Akbar's characteristic measures were those connected with religious innovation, about which it is difficult to speak with precision. The necessity of conciliating the proud warriors of Rájputana had taught him toleration from his earliest days. His favourite wife was a Rájput princess, and another wife is said to have been a Christian. Out of four hundred and fifteen of his *mansabdárs* whose names are recorded, as many as fifty-one were Hindus. Starting from the broad ground of general toleration, Akbar was gradually led on by the stimulus of cosmopolitan discussion to question the truth of his inherited faith. The counsels of his friend Abul Fazl, coinciding with that sense of superhuman omnipotence which is bred of despotic power, led him at last to promulgate a new state religion, based upon natural theology, and comprising the best practices of all known creeds. In this strange faith Akbar himself was the prophet, or rather the head of the church. Every morning he worshipped the sun in public, as being the representative of the divine soul that animates the universe, while he was himself worshipped by the ignorant multitude.

Akbar died in 1605, in his sixty-third year. He lies buried beneath a plain slab in the magnificent mausoleum which he had reared at Sikandra, near his capital of Agra. As his name is still cherished in India, so his tomb is still honoured, being covered by a cloth presented by Lord Northbrook when viceroy in 1873.

Jahángír.

The reign of Jahángír, his son, extended from 1605 to 1627. It is chiefly remarkable for the influence exercised over the emperor by his favourite wife, surnamed Núr Mahál, or the Light of the Harem. The currency was struck in her name, and in her hands centred all the intrigues that made up the work of administration. She lies buried by the side of her husband at Lahore, whither the seat of government had been moved by Jahángír, just as Akbar had previously transferred it from Delhi to Ágra. It was in the reign of Jahángír that the English first established themselves at Surat, and also sent their first embassy to the Mughal court.

Jahángír was succeeded by his son Sháh Jahán, who had rebelled against his father, as Jáhangír had rebelled against Akbar. Sháh Jahán's reign is generally regarded as the period when the Mughal empire attained its greatest magnificence, though not its greatest extent of territory. He founded the existing city of Delhi, which is still known to its Mahometan inhabitants as Jahánábád. At Delhi also he erected the celebrated peacock throne; but his favourite place of residence was Agra, where his name will ever be associated with the marvel of Indian architecture, the Táj Mahál. That most chaste and most ornamental of buildings was erected by Sháh Jahán as the mausoleum of his favourite wife Mumtaz Mahál, and he himself lies by her side. It is said that twenty thousand workmen laboured on the work for twenty years. Besides the Táj, Sháh Jahán also built at Agra within the old fort the palace and the pearl mosque, both of which, like the Táj, have been preserved to be objects of admiration to the present day. Sháh Jahán had four sons, whose fratricidal wars for the succession during their father's lifetime it would be tedious to dwell upon. Suffice it to say that Aurangzeb, by mingled treachery and violence, supplanted or overthrew his brothers and proclaimed himself emperor in 1658, while Sháh Jahán was yet alive.

Aurangzeb.

Aurangzeb's long reign, from 1658 to 1707, may be regarded as representing both the culminating point of Mughal power and the beginning of its decay. Unattractive as his character was, it contained at least some elements of greatness. None of his successors on the throne was anything higher than a debauchee or a puppet. He was the first to conquer the independent sultáns of the Deccan, and to extend his authority to the extreme south. But even during his lifetime two new Hindu nationalities were being formed in the Marhattás and the Síkhs; while immediately after his death the nawabs of the Deccan, of Oudh, and of Bengal raised themselves to practical independence. Aurangzeb had indeed enlarged the empire, but he had not strengthened its foundations. During the reign of his father Sháh Jahán he had been viceroy of the Deccan or rather of the northern portion only, which had been annexed to the Mughal empire since the reign of Akbar. His early ambition was to conquer the Mahometan kings of Bíjapur and Golconda, who, since the downfall of Vijayanagar, had been practically supreme over the south.

Rise of Marhattá power.

This object was not accomplished without many tedious campaigns, in which Sivají, the founder of the Marhattá confederacy, first comes upon the scene. In name Sivají was a feudatory of the house of Bíjapur, on whose behalf he held the rock-forts of his native Gháts; but in fact he found his opportunity in playing off the Mahometan powers against one another, and in rivalling Aurangzeb himself in the art of treachery. In 1680 Sivají died, and his son and successor, Sambhají, was betrayed to Aurangzeb and put to death. The rising Marhattá power was thus for a time checked, and the Mughal armies were set free to operate in the eastern Deccan. In 1686 the city of Bíjapur was taken by Aurangzeb in person, and in the following year Golconda also fell. No independent power then remained in the south, though the numerous local chieftains, known as *pálegárs* and *naiks*, never formally submitted to the Mughal empire. During the early years of his reign Aurangzeb had fixed his capital at Delhi, while he kept his dethroned father, Sháh Jahán, in close confinement at Agra. In 1682 he set out with his army on his victorious march into the Deccan, and from that time until his death in 1707 he never again returned to Delhi. In this camp life Aurangzeb may be taken as representative of one aspect of the Mughal rule, which has been picturesquely described by European travellers of that day. They agree in depicting the emperor as a peripatetic sovereign, and the empire as held together by its military highways no less than by the strength of its armies. The great road running across the north of the peninsula, from Dacca in the east to Lahore in the west, is generally attributed to the Afghán usurper, Sher Sháh. The other roads branching out southward from Agra, to Surat and Burhanpur and Golconda, were undoubtedly the work of Mughal times. Each of these roads was laid out with avenues of trees, with wells of water, and with frequent *saráis* or rest-houses. Constant communication between the capital and remote cities was maintained by a system of foot-runners, whose aggregate speed is said to have surpassed that of a horse. Commerce was conducted by means of a caste of bullock-drivers, whose occupation in India is hardly yet extinct.

Decline of Mughal empire.

On the death of Aurangzeb in 1707, the decline of the Mughal empire set in with extraordinary rapidity. Ten emperors after Aurangzeb are enumerated in the chronicles, but none of them has left any mark on history. His son and successor was Bahádur Sháh, who reigned only five years. Then followed in order three sons of Bahádur Sháh, whose united reigns occupy only five years more. In 1739 Nádir Sháh of Persia, the sixth and last of the great Mahometan conquerors of India, swept like a whirlwind over Hindustán, and sacked the imperial city of Delhi. Thenceforth the Great Mughal (Mogul) became a mere name, though the hereditary succession continued unbroken down to our own day Real power had passed into the hands of Mahometan courtiers and Marhattá generals, both of whom were then carving for themselves kingdoms out of the dismembered empire, until at last British authority placed itself supreme over all. From the time of Aurangzeb no Musalmán, however powerful, dared to assume the title of sultán or emperor, with the single exception of Tipú's brief paroxysm of madness. The name of *nawáb*, corrupted by Europeans into "nabob," appears to be an invention of the Mughals to express delegated authority, and as such it is the highest title conferred upon Mahometans at the present day, as *mahárájá* is the highest title conferred upon Hindus. At first nawábs were only found in important cities, such as Surat and Dacca, with the special function of administering civil justice; criminal justice was in the hands of the *kotwál*. The corresponding officials at that time in a large tract of country were the *subahdár* and the *faujdár*. But the title of subahdár, or viceroy, gradually dropped into desuetude, as the paramount power was shaken off, and nawáb became a territorial title with some distinguishing adjunct. During the troubled period of intrigue and assassination that followed on the death of Aurangzeb, two Mahometan foreigners rose to high position as courtiers and generals, and succeeded in transmitting their power to their sons. The one was Chin Kulich Khán, also called Asof Jah, and still more commonly Nizám-ul-Mulk, who was of Turkomán origin, and belonged to the Sunni sect. His independence at Hyderabad in the Deccan dates from 1712. The other was Saádat Alí Khán, a Persian, and therefore a Shiá, who was appointed subahdár or nawáb of Oudh in 1720. Thenceforth these two important provinces paid no more tribute to Delhi, though their hereditary rulers continued to seek formal recognition from the emperor on their succession. The Marhattás were in possession of the entire west and great part of the centre of the peninsula; while the rich and unwarlike province of Bengal, though governed by an hereditary line of nawábs founded by Murshid Kuli Khán in 1704, still continued to pour its wealth into the imperial treasury. The central authority never recovered from the invasion of Nádir Sháh in 1739, who carried off plunder variously estimated at from 8 to 30 millions sterling The Marhattás closed round Delhi from the south, and the Afgháns from the west. The victory of Pánipat, won by Ahmad Sháh Duráni over the united Marhattá confederacy in 1761, gave the Mahometans one more chance of rule. But Ahmad Sháh had no ambition to found a dynasty of his own, nor were the British in Bengal yet ready for territorial conquest. Sháh Alam, the lineal heir of the Mughal line, was thus permitted to ascend the throne of Delhi, where he lived during the great part of a long life as a puppet in the hands of Mahádají Sindhia He was succeeded by Akbar II., who lived similarly under the shadow of British protection. Last of all came Bahádur Sháh, who atoned for his association with the mutineers in 1857 by banishment to Burmah. Thus ended the Mughal line, after a history which covers three hundred and thirty years. Mahometan rule remodelled the revenue system, and has left behind forty millions of Musalmáns in British India.

End of Mughal line.

Early European Settlements.

Mahometan invaders have always entered India from the north-west. Her new conquerors approached from the sea and from the south. From the time of Alexander to that of Vasco da Gama, Europe had enjoyed little direct intercourse with the East. An occasional traveller brought back stories of powerful kingdoms and of untold wealth; but the passage by sea was unthought of, and by land many wide deserts and warlike tribes lay between. Commerce, indeed, never ceased entirely, being carried on chiefly by the Italian cities on the Mediterranean, which traded to the ports of the Levant. But to the Europeans of the 15th century India was practically an unknown land, which powerfully attracted the imagination of spirits stimulated by the Renaissance, and ardent for discovery. All the learning on this subject has been collected by Dr Birdwood in his admirable *Report on the Old Records of the India Office* (1879), from which the present section is largely borrowed. In 1492 Christopher Columbus set sail under the Spanish flag to seek India beyond the Atlantic, bearing with him a letter to the great khan of Tartary. The expedition under Vasco da Gama started from Lisbon five years later, and, doubling the Cape of Good Hope, cast anchor off the city of Calicut on the 20th May 1498, after a prolonged voyage of nearly eleven months. From the first Da Gama encountered hostility from the "Moors," or rather Arabs, who monopolized the sea-borne trade; but he seems to have found favour with the *zamorin*, or Hindu rájá of Malabar. It may be worth while to recall the contemporary condition of India at that epoch. An Afghán of the Lodi dynasty was on the throne of Delhi, and another Afghán king was ruling over Bengal. Ahmadábád in Guzerat, Gulbargah, Bíjapur, Ahmadnagar, and Ellichpur in the Deccan were each the capital of an independent Mahometan kingdom; while the Hindu rájá of Vijayanagar was recognized as paramount over the entire south, and was perhaps the most powerful monarch to be found at that time in all India. Neither Mughal nor Marhattá had yet appeared above the political horizon.

After staying nearly six months on the Malabar coast, Da Gama returned to Europe by the same route as he had come, bearing with him the following letter from the zamorin to the king of Portugal: "Vasco da Gama, a nobleman of your household, has visited my kingdom and has given me great pleasure. In my kingdom there is abundance of cinnamon, cloves, ginger, pepper, and precious stones. What I seek from thy country is gold, silver, coral, and scarlet." The arrival of Da Gama at Lisbon was celebrated with national rejoicings scarcely less enthusiastic than had greeted the return of Columbus. If the West Indies belonged to Spain by priority of discovery, Portugal might claim the East Indies by the same right. Territorial ambition conspired with the spirit of proselytism and with the greed of commerce to fill all Portuguese minds with the dream of a mighty Oriental empire. The early Portuguese discoverers were not traders or private adventurers, but admirals with a royal commission to conquer territory and promote the spread of Christianity A second expedition, consisting of thirteen ships and twelve hundred soldiers, under the command of Cabral, was despatched in 1500. "The sum of his instructions was to begin with preaching, and, if that failed, to proceed to the sharp determination of the sword." On his outward voyage Cabral was driven by stress of weather to the coast of Brazil. Ultimately he reached Calicut, and established factories both there and at Cochin, in the face of active hostility from the natives. In 1502 the king of Portugal obtained from Pope Alexander VI. a bull constituting him "lord of the navigation, conquests, and trade of Ethiopia, Arabia, Persia, and India." In that year Vasco da Gama sailed again to the East, with a fleet numbering twenty vessels. He formed an alliance with the rájás of Cochin and Cananore against the zamorin of Calicut, and bombarded the latter in his palace. In 1503 the great Alfonso d'Albuquerque is first heard of, as in command of one of three expeditions from Portugal. In 1505 a large fleet of twenty-two sail and fifteen thousand men was sent under Francisco de Almeida, the first Portuguese governor and viceroy of India. In 1509 Albuquerque succeeded as governor, and widely extended the area of Portuguese influence. Having failed in an attack upon Calicut, he seized Goa, which has ever since remained the capital of Portuguese India. Then, sailing round Ceylon, he captured Malacca, the key of the navigation of the Indian archipelago, and opened a trade with Siam and the Spice Islands. Lastly, he sailed back westwards, and, after penetrating into the Persian Gulf and the Red Sea, returned to Goa only to die in 1515. In 1524 Vasco da Gama came out to the East for the third time, and he too died at Cochin. For exactly a century, from 1500 to 1600, the Portuguese enjoyed a monopoly of Oriental trade.

"From Japan and the Spice Islands to the Red Sea and the Cape of Good Hope, they were the sole masters and dispensers of the treasures of the east; while their possessions along the Atlantic coast of Africa and in Brazil complete their maritime empire. But they never commanded the necessary resources either of military strength or personal character for its maintenance and defence. They were also in another way unprepared for the commerce of which they thus obtained the control. Their national character had been formed in their secular contest with the Moors, and above all things they were knights errant and crusaders, who looked on every pagan as an enemy at once of Portugal and of Christ. It is impossible for any one who has not read the contemporary narratives of their discoveries and conquests to conceive the grossness of the superstition and the cruelty with which the whole history of their exploration and subjugation of the Indies is stained. Albuquerque alone endeavoured to conciliate the good will of the natives, and to live in friendship with the Hindu princes, who were naturally better pleased to have the Portuguese, as governed by him, for their neighbours and allies than the Mahometans whom he had expelled or subdued. The justice and magnanimity of his rule did as much to extend and confirm the power of the Portuguese in the East as the courage and success of his military achievements; and in such veneration was his memory held by the Hindus, and even by the Mahometans, in Goa that they were accustomed to repair to his tomb, and there utter their complaints, as if in the presence of his shade, and call upon God to deliver them from the tyranny of his successors. The cruelties of Soarez, Sequeyra, Menezes, Da Gama, and succeeding viceroys drove the natives to desperation, and encouraged the princes of western India in 1567 to form a league against the Portuguese, in which they were at once joined by the king of Achin. Their undisciplined armies were not able to stand against the veteran soldiers of Portugal, 200 of whom, at Malacca, utterly routed and put to flight a force of 15,000 of the enemy. When, in 1578, Malacca was again besieged by the king of Achin, the small garrison of Portuguese succeeded in inflicting a loss on him of 10,000 men and all his cannon and junks. Twice again, in 1615 and for the last time in 1628, it was besieged, and on each occasion the Achinese were repulsed with equal bravery and good fortune. But these incessant attacks on the Portuguese evinced the decline of their empire, while the increased military forces sent out to the East proved an insupportable drain on the revenues and population of Portugal.

"In 1580 the crown of Portugal, consequent on the death of King Sebastian, became united with that of Spain, under Philip II.,—an event which proved the last fatal blow to the maritime and commercial supremacy of Portugal. It proved fatal in many ways, but chiefly because the interests of Portugal in Asia were subordinated to the European interests of Spain. In 1640 Portugal again became a separate kingdom, but in the meanwhile the Dutch and English had appeared in the Eastern Seas, and before their indomitable competition the Portuguese trade and dominion of the Indies withered away as rapidly as it had sprung up. The period of the highest development of Portuguese commerce was probably from 1590 to 1610, on the eve of the subversion of their political power by the Dutch, and when their political administration in India was at its lowest depth of degradation. At this period a single fleet of Portuguese merchantmen sailing from Goa to Cambay or Surat would number as many as 150 or 250 'carracks.' Now only one Portuguese ship sails from Lisbon to Goa in the year."

The only remaining Portuguese possessions in India are Goa, Daman, and Diu, all on the west coast, with an area of 1086 square miles and a population of 407,712 souls. The general census of 1871 also returned 426 Portuguese dwelling in British India, not including those of mixed descent, of whom about 30,000 are found in Bombay and 20,000 in Bengal, chiefly in the neighbourhood of Dacca and Chittagong. The latter are known as Firinghis; and, excepting that they retain the Roman Catholic faith and European surnames, are scarcely to be distinguished either by colour or by habits of life from the natives among whom they live.

Dutch settlements. The Dutch were the first European nation to break through the Portuguese monopoly. During the 16th century Bruges, Antwerp, and Amsterdam became successively the great emporia whence Indian produce, imported by the Portuguese, was distributed to Germany and even to England. At first the Dutch, following in the track of the English, attempted to find their way to India by sailing round the north coasts of Europe and Asia. William Barents is honourably known as the leader of three of these arctic expeditions, in the last of which he perished. The first Dutchman to double the Cape of Good Hope was Cornelius Houtman, who reached Sumatra and Bantam in 1596. Forthwith private companies for trade with the East were formed in many parts of the United Provinces, but in 1602 they were all amalgamated by the states-general into "The Dutch East India Company." Within a few years the Dutch had established factories on the continent of India, in Ceylon, in Sumatra, on the Persian Gulf, and on the Red Sea, besides having obtained exclusive possession of the Moluccas. In 1618 they laid the foundation of the city of Batavia in Java, to be the seat of the supreme government of the Dutch possessions in the East Indies, which had previously been at Amboyna. At about the same time they discovered the coast of Australia, and in North America founded the city of New Amsterdam or Manhattan, now New York. During the 17th century the Dutch maritime power was the first in the world. The massacre of Amboyna in 1623 led the English East India Company to retire from the Eastern seas to the continent of India, and thus, though indirectly, contributed to the foundation of the British Indian empire. The long naval wars and bloody battles between the English and the Dutch within the narrow seas were not terminated until William of Orange united the two crowns in 1689. In the far East the Dutch ruled without a rival, and gradually expelled the Portuguese from almost all their territorial possessions. In 1635 they occupied Formosa; in 1640 they took Malacca, a blow from which the Portuguese never recovered; in 1651 they founded a colony at the Cape of Good Hope, as a half-way station to the East; in 1658 they captured Jaffnapatam, the last stronghold of the Portuguese in Ceylon; in 1664 they wrested from the Portuguese all their earlier settlements on the pepper-bearing coast of Malabar. The rapid and signal downfall of the Dutch colonial empire is to be explained by its short-sighted commercial policy. It was deliberately based upon a monopoly of the trade in spices, and remained from first to last destitute of the true imperial spirit. Like the Phœnicians of old, the Dutch stopped short of no acts of cruelty towards their rivals in commerce; and, like the Phœnicians, they failed to introduce a respect for their own higher civilization among the natives with whom they came in contact. The knell of Dutch supremacy was sounded by Clive, when in 1758 he attacked the Dutch at Chinsurah both by land and water, and forced them to an ignominious capitulation. In the great French war from 1781 to 1811 England wrested from Holland every one of her colonies, though Java was restored in 1816 and Sumatra in exchange for Malacca in 1824. At the present time the Dutch flag flies nowhere on the mainland of India, though the quaint houses and regular canals at Chinsurah, at Negapatam, at Jaffnapatam, and at many petty ports on the Coromandel and Malabar coasts, remind the traveller of familiar scenes in the Netherlands. In the census of 1872 only seventy Dutchmen were enumerated throughout the whole of India.

English maritime expeditions. The earliest English attempts to reach India were made by the North-West Passage. In 1496 Henry VII. granted letters patent to John Cabot and his three sons (of whom one was the better known Sebastian) to fit out two ships for the exploration of that route. They failed, but discovered the island of Newfoundland, and sailed along the coast of America from Labrador to Virginia. In 1553 the ill-fated Sir Hugh Willoughby attempted to force a passage along the north of Europe and Asia, the successful accomplishment of which has been reserved for a Swedish savant of our own generation. Sir Hugh perished miserably, but his second in command, Chancellor, reached a harbour on the White Sea, now Archangel. Thence he penetrated by land to the court of the grand-duke of Moscow, and laid the foundation of "the Russia Company for carrying on the overland trade between India, Persia, Bokhara, and Moscow." Many subsequent attempts were made at the North-West Passage from 1576 to 1616, which have left on our modern maps the imperishable names of Frobisher, Davis, Hudson, and Baffin. Meanwhile, in 1577, Sir Francis Drake had circumnavigated the globe, and on his way home had touched at Ternate, one of the Moluccas, the king of which island agreed to supply the English nation with all the cloves it produced. "The first Englishman who actually visited India was Thomas Stephens, in 1579, unless there be any foundation in fact for the statement of William of Malmesbury, that in the year 883 Sighelmus of Sherborne, being sent by King Alfred to Rome with presents to the pope, proceeded from thence to the East Indies to visit the tomb of St Thomas at Mylapore (Mailapur, also called Saint Thomé, a suburb of Madras), and brought back with him a quantity of jewels and spices. Stephens was educated at New College, Oxford, and was rector of the Jesuits' College in Salsette. His letters to his father are said to have roused great enthusiasm in England to trade directly with India.

Overland expeditions. In 1583 three English merchants, Ralph Fitch, James Newberry, and Leedes, went out to India overland as mercantile adventurers. The jealous Portuguese threw them into prison at Ormuz, and again at Goa. At length Newberry settled down as a shopkeeper at Goa, Leedes entered the service of the Great Mughal, and Fitch, after a lengthened peregrination in Ceylon, Bengal, Pegu, Siam, Malacca, and other parts of the East Indies, returned to England."

The defeat of the "Invincible Armada" in 1588, at which time the crowns of Spain and Portugal were united, gave a fresh stimulus to maritime enterprise in England; and the successful voyage of Cornelius Houtman in 1596 showed the way round the Cape of Good Hope into waters hitherto monopolized by the Portuguese

East India Company. The foundation of the English East India Company was on this wise:—"In 1599 the Dutch, who had now firmly established their trade in the East, having raised the price of pepper against us from 3s. per lb to 6s. and 8s., the merchants of London held a meeting on the 22d September at Founders' Hall, with the lord mayor in the chair, and agreed to form an association for the purpose of trading directly with India. Queen Elizabeth also sent Sir John Mildenhall by Constantinople to the Great Mughal to apply for privileges for the English company, for which she was then preparing a charter, and on the 31st December 1600 the English East India Company was incorporated by royal charter under the title of 'The Governor and Company of Merchants of London trading to the East Indies.'" The original company had only one hundred and twenty-five shareholders, and a capital of £70,000, which was raised to £400,000 in 1612, when voyages were first undertaken on the joint-stock account. Courten's association, known also as "The Assada Merchants," from a factory founded by them in Madagascar, was established in 1635, but, after a period of internecine rivalry, united with the London Company in 1650. In 1655 the "Company of Merchant Adventurers" obtained a charter from Cromwell to trade with India, but united with the original company two years later. A more formidable rival subsequently appeared in the English company, or "General Society trading to the East Indies," which was incorporated under powerful patronage in 1698, with a capital of 2 millions sterling. According to Evelyn, in his *Diary* for March 5, 1698, "the old East India Company lost their business against the new company by ten votes in parliament, so many of their friends being absent, going to see a tiger baited by dogs." However, a compromise was speedily effected through the arbitration of Lord Godolphin in 1702, and the London and the English companies were finally amalgamated in 1709, under the style of "The United Company of Merchants of England trading to the East Indies." At the same time the Company advanced a loan to the state of £3,190,000 at 3 per cent. interest, in consideration of the exclusive privilege to trade to all places between the Cape of Good Hope and the Straits of Magellan.

The early voyages of the Company, from 1600 to 1612, are distinguished as the "separate voyages," twelve in number. The subscribers individually bore the expenses of each voyage, and reaped the whole profits. With the exception of the fourth, all these separate voyages were highly prosperous, the profits hardly ever falling below 100 per cent. After 1612 the voyages were conducted on the joint-stock account.

The following chronological sketch of the progress of the Company in the East is quoted almost verbatim from Dr Birdwood's valuable report:—

"The English were everywhere opposed from the first, as the Dutch had been, by the Portuguese; but James Lancaster succeeded in the first voyage (1602) in establishing commercial relations with the king of Achin, and at Priaman in the island of Sumatra, and with the Moluccas, and at Bantam, where he settled a factory or 'House of Trade' in 1603. In 1604 the Company undertook their second voyage, commanded by Sir Henry Middleton, who extended their trade to Banda and Amboyna. The success of these voyages was so great that it induced a number of private merchants to endeavour to obtain a participation in the trade; and in 1606 James I. granted a licence to Sir Edward Michelborne and others to trade 'to Cathay, China, Japan, Corea, and Cambaya.' Michelborne, however, on arriving in the East, instead of exploring new sources of commerce as the East India Company were doing, followed the pernicious example of the Portuguese in plundering the native traders among the islands of the Indian Archipelago. He in this way secured a considerable booty, but brought great disgrace on the British name, and much hindered the Company's business at Bantam. In 1608 Captain D. Middleton, in command of the fifth voyage, was prevented by the Dutch from trading at Banda, but succeeded in obtaining a cargo at Pulo Way. In that year also Captain Hawkins in the third voyage, commanded by Captain Keeling, proceeded from Surat as envoy from James I. and the East India Company to the court of the Great Mughal. He was graciously received by the emperor (Jahángír), and remained three years at Agra. In 1609 Captain Sharpey, who had conducted the fourth voyage, obtained the grant of free trade at Aden, and a cargo of pepper at Priaman. In that year also the Company constructed the dockyard at Deptford,—which was the beginning, observes Sir William Monson, 'of the increase of great ships in England.' In 1611 Sir Henry Middleton, in command of the sixth voyage, arrived before Cambay, and resolutely fought the Portuguese, who tried to beat him off, and obtained some important concessions from the native powers. In 1610-11 also Captain Hippon, commanding the seventh voyage, succeeded in establishing agencies at Masulipatam and in Siam, and at Patania or Patany on the Malay peninsula, and a factory at Pettipollee.

"In 1614 the Company's fleet, of the tenth voyage, under Captain Best, was attacked off Swalley, the port of Surat, at the mouth of the river Tápti, by an overwhelming force of Portuguese, who were utterly defeated in four successive engagements, to the great astonishment of the natives, who had hitherto considered them to be invincible. The first fruit of that decisive victory was the settlement of a factory at Surat, with subordinate agencies at Gogra, Ahmadábád, and Cambay. Trade was also opened with the Persian Gulf. In 1614 an agency was established by Mr Edwards of the Surat factory at Ajmír. In 1615 Sir Thomas Roe was sent out by James I. as ambassador to the court of Jahángír, and succeeded in placing the Company's trade in the Mughal dominions on a more favourable footing. The factory at Surat was the chief seat of the Company's government in western India until the presidency was transferred to Bombay in 1685. In 1618 the English established a factory at Mocha, while the Dutch compelled them to resign all pretensions to the Spice Islands. In that year also the Company failed in its attempt to open a trade with Dabul, Baticola, and Calicut, through a want of sincerity on the part of the zamorin. In 1619 it was permitted to settle a factory and build a fort at Jask, in the Persian Gulf.

"In 1619 also the 'Treaty of Defence' with the Dutch, to prevent disputes between the English and Dutch companies, was ratified. When it was proclaimed in the East, hostilities solemnly ceased for the space of an hour, while the Dutch and English fleets, dressed out in all their flags and with yards manned, saluted each other; but the treaty ended in the smoke of that stately salutation, and perpetual and fruitless contentions between the Dutch and English companies went on the same as ever. Up to that time the English company did not possess any portion of territory in sovereign right in the Indies, excepting in the island of Lantore or Great Banda. That island was governed by a commercial agent of the Company, who had under him thirty Europeans as clerks, overseers, and warehousemen; and these, with two hundred and fifty armed Malays, constituted the only force by which it was protected. In the islands of Banda and Pulo Roon and Rosengyn the Company possessed factories, in each of which were ten agents. At Macassar and Achin also they possessed factories or agencies, the whole being subordinate to Bantam. Such was the precarious situation of the English Company in the East at the commencement of their long struggle for commercial equality with the Dutch, whose ascendency in the Indian Archipelago was already firmly established on the basis of territorial dominion and authority. In 1620 the Dutch, notwithstanding the Treaty of Defence concluded the previous year, expelled the English from Pulo Roon and Lantore, and in 1621 from Bantam. The fugitive factors attempted to establish themselves first at Pulicat and afterwards at Masulipatam on the Coromandel coast, but were effectually opposed by the Dutch. In 1620 also the Portuguese made an attack upon the English fleet under Captain Shillinge, but were again defeated with great loss, and from that time the estimation in which the Portuguese were held by the natives of India steadily declined, while that of the English was proportionately raised. In that year the Company established agencies at Agra and Patná. In 1622 the English, joining with the Persians, attacked and took Ormuz from the Portuguese, and obtained from Sháh Abbas a grant in perpetuity of the customs of Gombroon. This was the first time that the English took the offensive against the Portuguese. In the same year the Company succeeded in re-establishing their factory at Masulipatam.

"On the 17th February 1623 occurred the 'Massacre of Amboyna;' and from that time the Dutch remained masters of Lantore and the neighbouring islands, and of the whole trade of the Indian Archipelago, until these islands were recaptured by the English in the great naval wars which commenced in 1793. In 1624 the English, unable to oppose the Dutch, withdrew nearly all their factories from the Archipelago, the Malay peninsula, Siam, and Japan. Some of the factors and agents retired to the island of Lagundy in the Strait of Sunda, but were forced, by its unhealthiness, to abandon it.

"In 1625-26 a factory was established at Armagáon on the Coromandel coast, subordinate to Masulipatam; but in 1628 Masulipatam was, in consequence of the oppressions of the native governor, for a time abandoned in favour of Armagáon, which then mounted twelve guns and had twenty-three factors and agents. In 1629 the factory at Bantam was re-established as an agency subordinate to Surat; and in 1630 Armagáon, reinforced by twenty soldiers, was placed under the presidency of Surat. In 1632 the factory was re-established at Masulipatam, by a firman, known as the 'Golden Firman,' from the king of Golconda. In 1634, by a firman dated February 2, the Company obtained from the Great Mughal liberty to trade in Bengal, without any other restriction than that their ships were to resort only to Pippli in Orissa. The Portuguese were in the same year expelled from Bengal. In 1634-35 Bantam was again raised to an independent presidency, and an agency was established at Tatta, or 'Scindy.' In 1637 Courten's Association (chartered 1635) settled agencies at Goa, Baticola, Kárwár (Carwar), Achin, and Rájápur. Its ships had in 1636 plundered some native vessels at Surat and Diu, which disgraced the Company with the Mughal authorities (who could not comprehend the distinction between the Company and the Association), and depressed the English trade with Surat, while that of the Dutch proportionately increased. In 1638 Armagáon was abandoned as unsuited for commerce; and in 1639-40 Fort St George, Maderaspatam ('Chinnepatam'), was founded by Francis Day, and the factors at Armagáon were at once removed to it. It was made subordinate to Bantam, until raised in 1683 to the rank of a presidency. In 1640 the Company established an agency at Bussorah, and a factory at Kárwár. Trade having much extended, the Company's yard at Deptford was found too small for their ships, and they purchased some copyhold ground at Blackwall, which at that time was a waste marsh, without an inhabitant; and there they opened another dockyard, in which was built the 'Royal George,' of 1200 tons, the largest ship yet seen in England. In 1642 the factories at Balasore and Húglí (Hooghly) were established. In 1645, in consequence of services rendered by Dr Gabriel Broughton, surgeon of the 'Hopewell,' to the emperor Sháh Jahán, additional privileges were granted to the Company; and in 1646 the governor of Bengal, who had also been professionally benefited by Broughton, made concessions which placed the factories at Balasore and Hooghly on a more favourable footing. In 1647 Courten's Association established its colony at Assada, in Madagascar. In 1652 Cromwell declared war against the Dutch on account of their accumulated injuries against the Company. In 1653 the Company's factory at Lucknow was withdrawn. No record has been found of its establishment. In 1658 the Company established a factory at Kásimbázár (Cossimbazar, 'Castle Bazaar'), and their establishments in Bengal were made subordinate to Fort St George instead of Bantam.

"In 1661 Bombay was ceded to the British crown as part of the dower of Catharine of Braganza. It was not delivered up by the Portuguese until 1665, and was transferred to the East India Company in 1668. The seat of the western presidency was removed to it from Surat in 1685. At that time the Company's establishments in the East Indies consisted of the presidency of Bantam, with its dependencies of Jambee, Macassar, and other places in the Indian Archipelago; Fort St George and its dependent factories on the Coromandel coast and Bengal; and Surat, with its affiliated dependency of Bombay, and factories at Broach, Ahmadábád, and other places in western India, and at Gombroon and Bussorah in the Persian Gulf and Euphrates valley. In that year also (1661) the factory at Biliapatam was founded. In 1663 the factories which had been established at Patná, Balasore, and Kásimbázár were ordered to be discontinued, and purchases made only at Hooghly. In 1664 Surat was pillaged by Sivají, but Sir George Oxenden bravely defended the English factory; and the Mughal emperor, in admiration of his conduct, granted the Company an exemption from customs for one year.

"In 1681 Bengal was separated from Madras, and Mr Hodges appointed 'agent and governor' of the Company's affairs 'in the Bay of Bengal, and of the factories subordinate to it at Kásimbázár, Patná, Balasore, Maldah, and Dacca. A corporal of approved fidelity, with twenty soldiers, was to be a guard to the agent's person at the factory of Hooghly, and to act against interlopers.' In 1683 Fort St George (Madras) was constituted a presidency. In 1684 Sir John Child was made 'captain-general and admiral of India,' and Sir John Wyborne 'vice-admiral and deputy governor of Bombay;' and in 1685 the seat of the presidency was transferred from Surat to Bombay. In 1686 the factory at Hooghly was much oppressed by the governor of Bengal, and the Company's business in India generally suffered from the wars of the Mughals and Marhattás. Sir John Child was therefore appointed 'governor-general,' with full power in India to make war or peace, and ordered to proceed to inspect the Company's possessions in Madras and Bengal, and arrange for their safety. On the 20th of December the Company's agent and council quitted the open factory at Hooghly, and retired to Sutanati (Calcutta). Tegnapatam (Fort St David) was first settled in this year (1686), and definitively established in 1691-92. In 1687 the Company retired from all its factories and agencies in Bengal to Madras, but established the settlement of Fort York at Bencoolen. In 1689 the Company's factories at Vizagapatam and Masulipatam were seized by the Mahometans, and the factors massacred. It was in 1689 also that at last the Company determined to consolidate their position in India on the basis of territorial sovereignty, in order to acquire the political status of an independent power in their relations with the Mughals and Marhattás. To this end they passed the following resolution for the guidance of the local governments in India:—'The increase of our revenue is the subject of our care, as much as our trade; 'tis that must maintain our force when twenty accidents may interrupt our trade; 'tis that must make us a nation in India; without that we are but a great number of interlopers, united by His Majesty's royal charter, fit only to trade where nobody of power thinks it their interest to prevent us; and upon this account it is that the wise Dutch, in all their general advices that we have seen, write ten paragraphs concerning their government, their civil and military policy, warfare, and the increase of their revenue, for one paragraph they write concerning trade.'"

It will be convenient to refer in this place to the other European nations who attempted at various times to open trade with the East. The Portuguese at no time attempted to found a company, but always maintained their Eastern trade as a royal monopoly. The first incorporated company was the English, established in 1600, which was quickly followed by the Dutch in 1602. The Dutch conquests, however, were made in the name of the state, and rank as national colonies, not as private possessions. Next came the French, whose first East India Company was formed in 1604, the second in 1611, the third in 1615, the fourth (Richelieu's) in 1642, the fifth (Colbert's) in 1644. The sixth was formed by the union of the French East and West India, Senegal, and China companies under the name of "The Company of the Indies," in 1719. The exclusive privileges of the company were, by the king's decree, suspended in 1769, and the company was finally abolished by the National Assembly in 1796. The first Danish East India Company was founded in 1612, and the second in 1670. The settlements of Tranquebar and Serampur were both founded in 1616, and acquired by the English by purchase from Denmark in 1845. Other Danish settlements on the mainland of India were Porto Novo, and Eddova and Holcheri on the Malabar coast. The company founded by the Scotch in 1695 may be regarded as having been still-born; and the "Royal Company of the Philippine Islands," incorporated by the king of Spain in 1733, had little to do with India proper; of more importance, though but short-lived, was "The Ostend Company," incorporated by the emperor of Austria in 1723, its factors being chiefly persons who had served the Dutch and English companies. But the opposition of the maritime powers forced the court of Vienna in 1727 to suspend the company's charter for seven years. The Ostend company, after passing through a very trying existence, prolonged through the desire of the Austrian Government to participate in the growing East India trade, became bankrupt in 1784, and was finally extinguished by the regulations which were prescribed on the renewal of the English East India Company's charter in 1793. The last nation of Europe to engage in maritime trade with India was Sweden. When the Ostend company was suspended, a number of its servants were thrown out of employment, of whose special knowledge of the East Mr Henry Koning, of Stockholm, took advantage, obtaining a charter for the "Swedish Company," dated June 13, 1731. This company was reorganized in 1806. The extent to which foreign nations now carry on direct dealings with India may be inferred approximately from the following figures, taken from the census report of 1871. There were then in British India about 8000 inhabitants of continental Europe; but of these the nationality of only 2628 was more particularly specified, chiefly in Bengal. Germans numbered 755, French, 631; Portuguese, 426; Italians, 282; Greeks, 127; Swedes, 73; Russians, 72; Dutch, 70; Norwegians, 58; Danes, 45; Spaniards, 32; Belgians, 20; Swiss, 19; Turks, 18.

British Empire (1765 *to* 1881).

The political history of the British in India begins in the 18th century with the French wars in the Carnatic. Fort St George, the nucleus of Madras, was their earliest territorial possession, properly so called, in India, having been founded by Thomas Day in 1639. The land on which it stood, with an area round of about 5 miles in length by 1 mile in breadth, was purchased from the rájá of Chandragiri, who claimed to be the lineal descendant of the Hindu emperors of Vijayanagar. The French settlement of Pondicherri, about 100 miles lower down the Coromandel coast, was established in 1672, and for many years the English and French traded side by side, without either active rivalry or territorial ambition. The English, especially, appear to have been submissive to the native powers at Madras no less than in Bengal. They paid their annual rent of 1200 pagodas (say £500) to the deputies of the Mughal empire when Aurangzeb annexed the south, and on two several occasions bought off a besieging army with a heavy bribe.

On the death of Aurangzeb in 1707, the whole of southern India became practically independent of Delhi. In the Deccan Proper, the Nizám-ul-Mulk founded an independent dynasty, with Hyderabad for its capital, which exercised a nominal sovereignty over the entire south. The Carnatic, or the lowland tract between the central plateau and the eastern sea, was ruled by a deputy of the nizám, known as the nawáb of Arcot, who in his turn asserted claims to hereditary sovereignty. Further south, Trichinopoli was the capital of a Hindu rájá, and Tanjore formed another Hindu kingdom under a degenerate descendant of the line of Sivají. Inland, Mysore was gradually growing into a third Hindu state, while everywhere local chieftains, called *pálegárs* or *naiks*, were in semi-independent possession of citadels or hill-forts.

French and English wars.

In that condition of affairs the flame of war was kindled between the English and the French in Europe in 1745. Dupleix was at that time governor of Pondicherri, and Clive was a young writer at Madras. An English fleet first appeared on the Coromandel coast, but Dupleix by a judicious present induced the nawáb of Arcot to interpose and prevent hostilities. In 1746 a French squadron arrived, under the command of La Bourdonnais. Madras surrendered almost without a blow, and the only settlement left to the English was Fort St David, a few miles south of Pondicherri, where Clive and a few other fugitives sought shelter. The nawáb, faithful to his policy of impartiality, marched with 10,000 men to drive the French out of Madras, but he was signally defeated by a French force of only four hundred men and two guns. In 1748 an English fleet arrived under Admiral Boscawen and attempted the siege of Pondicherri, while a land force co-operated under Major Lawrence, whose name afterwards became associated with that of Clive. The French successfully repulsed all attacks, and at last peace was restored by the treaty of Aix-la-Chapelle, which gave back Madras to the English (1748).

The first war with the French was merely an incident in the greater contest in Europe. The second war had its origin in Indian politics, while England and France were at peace. The easy success of the French arms had inspired Dupleix with the ambition of founding a French empire in India, under the shadow of the existing Mahometan powers. Disputed successions at Hyderabad and at Arcot supplied him with the opportunity that he lacked. On both thrones he placed nominees of his own, and for a short time posed as the supreme arbiter of the entire south. In boldness of conception, and in knowledge of Oriental diplomacy, Dupleix has had probably no rival. But he was no soldier, and he was destined in that sphere to encounter the "heaven-born genius" of Clive. For the English of Madras, under the instinct of self-preservation, were compelled to maintain the cause of another candidate to the throne of Arcot in opposition to the nominee of Dupleix. This candidate was Muhammad Alí, afterwards known in history as Wála-jah. The war that then ensued between the French and English, each with their native allies, has been exhaustively described in the pages of Orme. The one incident that stands out conspicuously is the capture and subsequent defence of Arcot by Clive in 1751. This heroic feat, even more than the battle of Plassey, established the reputation of the English for valour throughout India. Shortly afterwards Clive returned to England in ill-health, but the war continued fitfully for many years. On the whole, English influence predominated in the Carnatic, and their candidate, Muhammad Alí, maintained his position at Arcot. But the French were no less supreme in the Deccan, whence they were able to take possession of the coast tract called "the Northern Circars." The final struggle was postponed until 1760, when Colonel (afterwards Sir Eyre) Coote won the decisive victory of Wandewash over the French general Lally, and proceeded to invest Pondicherri, which was starved into capitulation in January 1761. A few months later the hill-fortress of Gingee (Chenji) also surrendered. In the words of Orme, "That day terminated the long hostilities between the two rival European powers in Coromandel, and left not a single ensign of the French nation avowed by the authority of its Government in any part of India."

Cliv[e]

Meanwhile the interest of history shifts with Clive to Bengal. The first English settlement in that part of India was Pippli in Orissa, to which the East India Company was permitted to trade in 1633, six years before the foundation of Madras. The river on which Pippli stood has since silted up, and the very site of the English settlement is now unknown and undiscoverable. In 1642 factories were opened at Balasore and Húglí (Hooghly), and in 1681 Bengal was erected into a presidency, as yet subject to Madras. The name of Calcutta is not heard of till 1686, when Job Charnock, the chief at Hooghly, was expelled by the deputy of Aurangzeb, and settled lower down the river on the opposite bank. There he acquired a grant of the three petty villages of Sutanati, Gobindpur, and Kálíghát (Calcutta), and founded the original Fort William in 1696.

Calc[utta]

At the time of Aurangzeb's death in 1707 the nawáb or governor of Bengal was Murshid Kulí Khán, known also

Ben[gal] naw[ábs]

in European history as Jafar Khán. By birth a Bráhman, and brought up as a slave in Persia, he united the administrative ability of a Hindu to the fanaticism of a renegade. Hitherto the capital of Bengal had been at Dacca on the eastern frontier of the empire, whence the piratical attacks of the Portuguese and of the Arakanese or Maghs could be most easily checked. Murshid Kulí Khán transferred his residence to Murshidábád (Moorshedabad), in the neighbourhood of Kásimbázár (Cossimbazar), the river port of all the Ganges trade. The English, the French, and the Dutch had each factories at Kásimbázár, as well as at Dácca, Patná, and Maldah. But Calcutta was the headquarters of the English, Chandarnagar of the French, and Chinsurah of the Dutch, all three towns being situated close to each other in the lower reaches of the Hooghly, where the river is navigable for large ships. Murshid Kulí Khán ruled over Bengal prosperously for twenty-one years, and left his power to a son-in-law and a grandson. The hereditary succession was broken in 1740 by Alí Vardi Khán, who was the last of the great nawábs of Bengal. In his days the Marhattá horsemen began to ravage the country, and the English at Calcutta obtained permission to erect an earth-work, which is known to the present day as the Marhattá ditch. Alí Vardi Khán died in 1756, and was succeeded by his grandson, Siráj-ud-Daulá (Surajah Dowlah), a youth of only eighteen years, whose ungovernable temper led to a rupture with the English within two months after his accession. In pursuit of one of his own family who had escaped from his vengeance, he marched upon Calcutta with a large army. Many of the English fled down the river in their ships. The remainder surrendered after a feeble resistance, and were thrown as prisoners into the "black hole" or military jail of Fort William, a room about 18 feet square, with only two small windows barred with iron. It was the month of June, in which the tropical heat of Calcutta is most oppressive. When the door of the prison was opened in the morning, only twenty-three persons out of one hundred and forty-six were found alive.

The news of this disaster fortunately found Clive returned to Madras, where also was a squadron of king's ships under Admiral Watson. Clive and Watson promptly sailed to the mouth of the Ganges with all the troops that could be got together. Calcutta was recovered with little fighting, and the nawáb consented to a peace which restored to the Company all their privileges, and gave them compensation for their losses of property. It is possible that matters might have ended here if a fresh cause of hostilities had not suddenly arisen. War had just been declared between the English and French in Europe, and Clive, following the traditions of his early warfare in the Carnatic, attacked and captured Chandarnagar. Siráj-ud-Daulá, exasperated by that breach of neutrality within his own dominions, took the side of the French. But Clive, again acting upon the policy he had learned from Dupleix, had provided himself with a rival candidate to the throne. Undaunted, he marched out to the battlefield of Plassey (Palási), at the head of about 1000 Europeans and 2100 sepoys, with 9 pieces of artillery. The Mahometan army is said to have consisted of 50,000 foot, 18,000 horse, and 50 pieces of cannon. But there was a traitor in the Mahometan camp in the person of Mír Jafar, who had married a sister of the late nawáb, Alí Vardi Khán. The battle was short but decisive. After a few rounds of artillery fire, Suráj-ud-Daulá fled, and the road to Murshidábád was left open.

The battle of Plassey was fought on June 23, 1757, an anniversary afterwards remembered when the mutiny was at its height in 1857. History has agreed to adopt this date as the beginning of the British empire in the East; but the immediate results of the victory were comparatively small, and several more hard-won fights were fought before even the Bengalis would admit the superiority of the British arms. For the moment, however, all opposition was at an end. Clive, again following in the steps of Dupleix, placed his nominee, Mír Jafar, upon the *masnad* at Murshidábád, being careful to obtain a patent of investiture from the Mughal court. Enormous sums were exacted from Mír Jafar as the price of his elevation. The Company claimed 10,000,000 rupees as compensation for losses; for the English, the Indian, and the Armenian inhabitants of Calcutta there were demanded the sums of 5,000,000, 2,000,000, and 700,000 rupees; for the squadron 2,500,000 rupees, and an equal sum for the army. The members of the council received the following amounts:—Mr Drake, the governor, and Colonel Clive 280,000 rupees each; and Mr Becker, Mr Watts, and Major Kilpatrick 240,000 rupees each. The whole amounted to £2,697,750. The English, deluded by their avarice, still cherished extravagant ideas of Indian wealth; nor would they listen to the ungrateful truth. But it was found that there were no funds in the treasury to satisfy their inordinate demands, and they were obliged to be contented with one-half the stipulated sums, which, after many difficulties, were paid in specie and in jewels, with the exception of 584,905 rupees. The shares of the council were, however, paid in full. At the same time the nawáb made a grant to the Company of the *zamíndárí* rights over an extensive tract of country round Calcutta, now known as the district of the Twenty-four Parganás. The area of this tract was about 882 square miles, and it paid a permanent revenue or quit rent of about £23,000. The gross rental at first payable to the Company was £53,000, but within a period of ten years it had risen to £146,000. Originally the Company possessed only the *zamíndárí* rights, *i.e.*, revenue jurisdiction. The superior lordship, or right to receive the quit rent, remained with the nawáb; but in 1759 this also was parted with by the Delhi emperor, the nominal suzerain of the nawáb, in favour of Clive, who thus became the landlord of his own masters, the Company. At that time also Clive was enrolled among the nobility of the Mughal empire, with the rank of commander of 6000 foot and 5000 horse. Clive's *jagír*, as it was called, subsequently became a matter of inquiry in England, and on his death it passed to the Company, thus merging the *zamíndárí* in the proprietary rights.

In 1758 Clive was appointed by the court of directors the first governor of all the Company's settlements in Bengal. From two quarters troubles threatened, which perhaps Clive alone was capable of overcoming. On the west the *sháhzáda* or imperial prince, known afterwards as the emperor Sháh Alam, with a mixed army of Afgháns and Marhattás, and supported by the nawáb wazír of Oudh, was advancing his own claims to the province of Bengal. In the south the influence of the French under Lally and Bussy was overshadowing the British at Madras. But the name of Clive exercised a decisive effect in both directions. Mír Jafar was anxious to buy off the sháhzáda, who had already invested Patná. But Clive in person marched to the rescue, with an army of only 450 Europeans and 2500 sepoys, and the Mughal army dispersed without striking a blow. In the same year Clive despatched a force southwards under Colonel Forde, which recaptured Masulipatam from the French, and permanently established British influence throughout the Northern Circars, and at the court of Hyderabad. He next attacked the Dutch, the sole European nation that might yet be a formidable rival to the English. He defeated them both by land and water; and from that time their settlement at Chinsurah existed only on sufferance.

Influence of E.I.C.

From 1760 to 1765, while Clive was at home, the history of the English in Bengal contains little that is creditable. Clive had left behind him no system of government, but merely the tradition that unlimited sums of money might be extracted from the natives by the mere terror of the English name. In 1761 it was found expedient and profitable to dethrone Mír Jafar, the English nawáb of Murshidábád, and substitute his son-in-law, Mír Kásim, in his place. On that occasion, besides private donations, the English received a grant of the three districts of Bardwán, Midnapur, and Chittagong, estimated to yield a net revenue of half a million sterling. But Mír Kásim proved to possess a will of his own, and to cherish dreams of independence. He retired from Murshidábád to Monghyr, a strong position on the Ganges, which commanded the only means of communication with the west. There he proceeded to organize an army, drilled and equipped after European models, and to carry on intrigues with the nawáb wazír of Oudh. The actual outbreak of hostilities with the English happened on this wise. The Company's servants claimed the privilege of carrying on private trade throughout Bengal, free from inland dues and all other imposts. The assertion of this claim caused frequent affrays between the customs' officers of the nawáb and those traders who, whether falsely or not, represented that they were acting on behalf of the servants of the Company. The nawáb alleged that his civil authority was everywhere being set at nought. The majority of the council at Calcutta would not listen to his statements. The governor, Mr Vansittart, and Warren Hastings, then a junior member of council, attempted to effect some compromise. But the controversy had become too hot. The nawáb's officers fired upon an English boat, and forthwith all Bengal was in a blaze. A force of 2000 sepoys was cut to pieces at Patná, and about 200 Englishmen in various parts of the province fell into the hands of the Mahometans, and were subsequently massacred. But as soon as regular warfare commenced Mír Kásim met with no more successes. His trained regiments were defeated in two pitched battles by Major Adams, at Gheriah and at Udha-nálá, and he himself took refuge with the nawáb wazír of Oudh, who refused to deliver him up. This led to a prolongation of the war. Sháh Alam, who had now succeeded his father as emperor, and Shujá-ud-Daulá, the nawáb wazír of Oudh, united their forces, and threatened Patná, which the English had recovered. A more formidable danger appeared in the English camp, in the form of the first sepoy mutiny. This was quelled by Major (afterwards Sir Hector) Munro, who ordered twenty-four of the ringleaders to be blown from guns, an old Mughal punishment. In 1764 Major Munro won the decisive battle of Baxár, which laid Oudh at the feet of the conquerors, and brought the Mughal emperor as a suppliant to the English camp.

Massacre of Patná.

Meanwhile the council at Calcutta had twice found the opportunity they desired of selling the government of Bengal to a new nawáb. But in 1765 Clive (now Baron Clive of Plassey, in the peerage of Ireland) arrived at Calcutta, as governor of Bengal for the second time, to settle the entire system of relations with the native powers. Two objects stand out conspicuously in his policy. First, he sought to acquire the substance, though not the name, of territorial power, by using the authority of the Mughal emperor for so much as he wished, and for no more; and, secondly, he desired to purify the Company's service by prohibiting illicit gains, and at the same time guaranteeing a reasonable remuneration from honest sources. In neither respect were the details of his plans carried out by his successors. But the beginning of our Indian administration dates from this second governorship of Clive, just as the origin of our Indian empire dates from his victory at Plassey. Clive's first step was to hurry up from Calcutta to Allahábád, and there settle in person the fate of nearly half India. Oudh was given back to the nawáb wazír, on condition of his paying half a million sterling towards the expenses of the war. The provinces of Allahábád and Kora, forming the greater part of the Doáb, were handed over to Sháh Alam himself, who in his turn granted to the Company the *díwání* or financial administration of Bengal, Behar, and Orissa, and also the territorial jurisdiction of the Northern Circars. A puppet nawáb was still maintained at Murshidábád, who received an annual allowance of about half a million sterling; and half that amount was paid to the emperor as tribute from Bengal. Thus was constituted the dual system of government, by which the English received all the revenues and undertook to maintain an army for the defence of the frontier, while the criminal jurisdiction vested in the nawáb. In Indian phraseology, the Company was diwán and the nawáb was nizám. As a matter of general administration, the actual collection of the revenues still remained for some years in the hands of native officials. In attempting to reorganize and purify the Company's service, Clive undertook a task yet more difficult than to partition the valley of the Ganges. The officers, civil and military alike, were all tainted with the common corruption. Their legal salaries were absolutely insignificant, but they had been permitted to augment them ten and a hundredfold by means of private trade and gifts from the native powers. Despite the united resistance of the civil servants, and an actual mutiny of two hundred military officers, Clive carried through his reforms. Both private trade and the receipt of presents were absolutely prohibited for the future, while a substantial increase of pay was provided out of the monopoly of salt.

Wa[rren] Ha[stings].

Lord Clive quitted India for the third and last time in 1767. Between that date and the arrival of Warren Hastings in 1772 nothing of importance occurred in Bengal beyond the terrible famine of 1770, which is officially reported to have swept away one-third of the inhabitants. The dual system of government, however, established by Clive, had proved a failure. Warren Hastings, a tried servant of the Company, distinguished alike for intelligence, for probity, and for knowledge of Oriental manners, was nominated governor by the court of directors, with express instructions to carry out a predetermined series of reforms. In their own words, the court had resolved to "stand forth as diwán, and to take upon themselves, by the agency of their own servants, the entire care and administration of the revenues." In the execution of this plan, Hastings removed the exchequer from Murshidábád to Calcutta, and for the first time appointed European officers, under the now familiar title of collectors, to superintend the revenue collections and preside in the civil courts. The urgency of foreign affairs, and subsequently internal strife at the council table, hindered Hastings from developing further the system of civil administration, a task finally accomplished by Lord Cornwallis.

Though Hastings always prided himself specially upon that reform, as well as upon the improvements he introduced into the collection of the revenues from salt and opium, his name will be remembered in history for the boldness and success of his foreign policy. From 1772 to 1774 he was governor of Bengal; from 1774 to 1785 he was the first titular governor-general of India, presiding over a council nominated, like himself, not by the Company, but by an Act of Parliament, known as the Regulating Act. In his domestic policy he was greatly hampered by the opposition of Francis; but, so far as regards external relations with Oudh, with the

Marhattás, and with Hyder Ali, he was generally able to compel assent to his own measures. His treatment of Oudh may here be passed over as not being material to the general history of India, while the personal aspects of his rule have been fully discussed in a separate article (vol. xi. p. 512). To explain his Marhattá policy, it will be necessary to give a short retrospective sketch of the history of that people.

Sivají the Great, as already mentioned, died in 1680, while Aurangzeb was still on the throne. The family of Sivají produced no great names, either among those who continued to be the nominal chiefs of the Marhattá confederacy, with their capital at Sátárá, or among the rájás of Kolhapur and Tanjore. All real power passed into the hands of the peshwá, or Bráhman minister, who founded in his turn an hereditary dynasty at Poona, dating from the beginning of the 18th century. Next rose several Marhattá generals, who, though recognizing the suzerainty of the peshwá, carved out for themselves independent kingdoms in different parts of India, sometimes far from the original home of the Marhattá race. Chief among these generals were the gáikwár in Guzerat, Sindhia, and Holkar in Málwa, and the Bhonslá rájá of Berar and Nágpur. At one time it seemed probable that the Marhattá confederacy would expel the Mahometans even from northern India; but the decisive battle of Pánipat, won by the Afgháns in 1761, gave a respite to the Delhi empire. The Marhattá chiefs never again united heartily for a common purpose, though they still continued to be the most formidable military power in India. In especial, they dominated over the British settlement of Bombay on the western coast, which was the last of the three presidencies to feel the lust of territorial ambition. For more than a hundred years, from its acquisition in 1661 to the outbreak of the first Marhattá war in 1775, the English on the west coast possessed no territory outside the island of Bombay and their fortified factory at Surat.

ssions the m- ny.

The Bombay Government was naturally emulous to follow the example of Madras and Bengal, and to establish its influence at the court of Poona by placing its own nominee upon the throne. The attempt took form in 1775 in the treaty of Surat, by which Raghunáth Ráo, one of the claimants to the throne of the peshwá, agreed to cede Salsette and Bassein to the English, in consideration of being himself restored to Poona. The military operations that followed are known as the first Marhattá war. Warren Hastings, who in his capacity of governor-general claimed a right of control over the decisions of the Bombay Government, strongly disapproved of the treaty of Surat, but, when war once broke out, he threw the whole force of the Bengal army into the scale. One of his favourite officers, General Goddard, marched across the peninsula from sea to sea, and conquered the rich province of Guzerat almost without a blow. Another, Captain Popham, stormed the rock-fortress of Gwalior, which was regarded as the key of Hindustán. Those brilliant successes atoned for the disgrace of the convention of Wargaum in 1779, when the Marhattás dictated terms to a British force, but the war was protracted until 1782. It was then closed by the treaty of Salbye, which practically restored the *status quo*. Raghunáth Ráo, the English claimant, was set aside; Guzerat was restored, and only Salsette and some other small islands were retained by the English.

st rhat- war.

rst ysore ir.

Meanwhile Warren Hastings had to deal with a more formidable enemy than the Marhattá confederacy. The reckless conduct of the Madras Government had roused the hostility both of Hyder Ali of Mysore and of the nizám of the Deccan, the two strongest Musalmán powers in India, who attempted to draw the Marhattás into an alliance against the English. The diplomacy of Hastings won over the nizám and the Marhattá rájá of Nágpur, but the army of Hyder Ali fell like a thunderbolt upon the British possessions in the Carnatic. A strong detachment under Colonel Baillie was cut to pieces at Pollilore, and the Mysore cavalry ravaged the country unchecked up to the walls of Madras. For the second time the Bengal army, stimulated by the energy of Hastings, saved the honour of the English name. Sir Eyre Coote, the victor of Wandewash, was sent by sea to relieve Madras with all the men and money available, while Colonel Pearse marched south overland to overawe the rájá of Berar and the nizám. The war was hotly contested, for Sir Eyre Coote was now an old man, and the Mysore army was well-disciplined and equipped, and also skilfully handled by Hyder and his son Tipú (Tippoo). Hyder died in 1782, and peace was finally concluded with Tipú in 1784, on the basis of a mutual restitution of all conquests.

It was Warren Hastings's merit to organize the empire which Clive founded. He was governor or governor-general for thirteen years, a longer period than any of his successors. During that time the English lost the American colonies, but in India their reputation steadily rose to its highest pitch. Within a year Hastings was succeeded by Lord Cornwallis, the first English nobleman of rank who undertook the office of governor-general. His rule lasted from 1786 to 1793, and is celebrated for two events—the introduction of the permanent settlement into Bengal, and the second Mysore war. If the foundations of the system of civil administration were laid by Hastings, the superstructure was erected by Cornwallis. It was he who first entrusted criminal jurisdiction to Europeans, and established the Nizámat Sadr Adálat, or supreme court of criminal judicature, at Calcutta; and it was he who separated the functions of collector and judge. The system thus organized in Bengal was afterwards transferred to Madras and Bombay, when those presidencies also acquired territorial sovereignty.

Corn-wallis.

But the achievement most familiarly associated with the name of Cornwallis is the permanent settlement of the land revenue of Bengal. Up to his time the revenue had been collected pretty much according to the old Mughal system. *Zamíndárs*, or Government farmers, whose office always tended to become hereditary, were recognized as having a right of some sort to collect the revenue from the actual cultivators. But no principle of assessment existed, and the amount actually realized varied greatly from year to year. Hastings had the reputation of bearing hard upon the *zamíndárs*, and was absorbed in other critical affairs of state or of war. On the whole he seems to have looked to experience, as acquired from a succession of quinquennial settlements, to furnish the standard rate of the future. Francis, on the other hand, Hastings's great rival, deserves the credit of being among the first to advocate a limitation of the state demand in perpetuity. The same view recommended itself to the authorities at home, partly because it would place their finances on a more stable basis, partly because it seemed to identify the *zamíndár* with the more familiar landlord. Accordingly, Cornwallis took out with him in 1787 instructions to introduce a permanent settlement. The process of assessment began in 1789 and terminated in 1791. No attempt was made to measure the fields or calculate the out-turn as had been done by Akbar, and is now done when occasion requires in the British provinces; but the amount payable was fixed by reference to what had been paid in the past. At first the settlement was called decennial, but in 1793 it was declared permanent for ever. The total assessment amounted to *sikka* Rs.26,800,989, or about $2\frac{3}{4}$ millions sterling. Though Lord Cornwallis carried the scheme into execution, all praise or blame, so far as details are concerned, must

Permanent settlement.

belong to Sir John Shore, afterwards Lord Teignmouth, whose knowledge of the country was unsurpassed by that of any civilian of his time. Shore would have proceeded more cautiously than Cornwallis's preconceived idea of a proprietary body and the court of directors' haste after fixity permitted.

Second Mysore war. The second Mysore war of 1790–92 is noteworthy on two accounts: Lord Cornwallis, the governor-general, led the British army in person, with a pomp and lavishness of supplies that recalled the campaigns of Aurangzeb; and the two great native powers, the nizám of the Deccan and the Marhattá confederacy, co-operated as allies of the British. In the result, Tipú Sultán submitted when Lord Cornwallis had commenced to beleaguer his capital. He agreed to yield one-half of his dominions to be divided among the allies, and to pay three millions sterling towards the cost of the war. Those conditions he fulfilled, but ever afterwards he burned to be revenged upon his English conquerors.

Wellesley. The period of Sir John Shore's rule as governor-general, from 1793 to 1798, was uneventful. In 1798 Lord Mornington, better known as the marquis of Wellesley, arrived in India, already inspired with imperial projects that were destined to change the map of the country. Mornington was the friend and favourite of Pitt, from whom he is thought to have derived the comprehensiveness of his political vision and his antipathy to the French name. From the first he laid down as his guiding principle that the English must be the one paramount power in the peninsula, and that native princes could only retain the insignia of sovereignty by surrendering the substance of independence. The subsequent political history of India has been but the gradual development of this policy, which received its finishing touch when Queen Victoria was proclaimed empress of India in 1877.

To frustrate the possibility of a French invasion of India, led by Napoleon in person, was the governing idea of Wellesley's foreign policy; for France at this time, and for many years later, filled the place afterwards occupied by Russia in the imagination of English statesmen. Nor was the possibility so remote as might now be thought. French regiments guarded and overawed the nizám of Hyderabad. The soldiers of Sindhia, the military head of the Marhattá confederacy, were disciplined and led by French adventurers. Tipú Sultán carried on a secret correspondence with the French directorate, and allowed a tree of liberty to be planted in his dominions. The islands of Mauritius and Bourbon afforded a convenient half-way house both for French intrigue and for the assembling of a hostile expedition. Above all, Napoleon Buonaparte was then in Egypt, dreaming of the conquests of Alexander; and no man knew in what direction he might turn his hitherto unconquered legions. Wellesley first addressed himself to the nizám, where his policy prevailed without serious opposition. The French battalions at Hyderabad were disbanded, and the nizám bound himself by treaty not to take any European into his service without the consent of the English Government,—a clause since inserted in every engagement entered into with native powers. Next, the whole weight of Wellesley's resources was turned against Tipú, whom Cornwallis had scotched but not killed. His intrigues with the French were laid bare, and he was given an opportunity of adhering to the new subsidiary system.

Third Mysore war. On his refusal war was declared, and Wellesley came down in state to Madras to organize the expedition in person, and watch over the course of events. One English army marched into Mysore from Madras, accompanied by a contingent from the nizám. Another advanced from the western coast. Tipú, after offering but a feeble resistance in the field, retired into Seringapatam, and, when his capital was stormed, died fighting bravely in the breach. Since the battle of Plassey no event so greatly impressed the native imagination as the capture of Seringapatam, which won for General Harris a peerage and for Wellesley an Irish marquisate. In dealing with the territories of Tipú, Wellesley acted with unusual moderation. The central portion, forming the old state of Mysore, was restored to an infant representative of the Hindu rájás, whom Hyder Ali had dethroned, while the rest was partitioned between the nizám, the Marhattás, and the English. At about the same time the province of the Carnatic, or all that large portion of southern India ruled by the nawáb of Arcot, and also the principality of Tanjore, were placed under direct British administration, thus constituting the Madras presidency almost as it has existed to the present day.

Ma[rhattá] con[fede]racy. The Marhattás had been the nominal allies of the English in both their wars with Tipú, but they had never given active assistance, nor were they secured to the English side as the nizám now was. The Marhattá powers at this time were five in number. The recognized head of the confederacy was the peshwá of Poona, who ruled the hill country of the Western Gháts, the cradle of the Marhattá race. The fertile province of Guzerat was annually harried by the horsemen of the gáikwár of Baroda. In Central India two military leaders, Sindhia of Gwalior and Holkar of India, alternately held the pre-eminency. Towards the east the Bhonslá rájá of Nágpur, sprung from the same stock as Sivají, reigned from Berar to the coast of Orissa. Wellesley tried assiduously to bring these several Marhattá powers within the net of his subsidiary system. At last, in 1802, the necessities of the peshwá, who had been defeated by Holkar, and driven as a fugitive into British territory, induced him to sign the treaty of Bassein, by which he pledged himself to hold communications with no other power, European or native, and ceded territory for the maintenance of a subsidiary force. This greatly extended the English territorial influence in the Bombay presidency, but led directly to the second Marhattá war, for neither Sindhia nor the rájá of Nágpur would tolerate this abandonment of Marhattá independence.

Wa[r] wit[h] Sin[dhia,] Ho[lkar,] and of N[ágpur]. The campaigns that followed are perhaps the most glorious in the history of the British arms in India. The general plan and the adequate provision of resources were due to the marquis of Wellesley, as also the indomitable spirit that could not anticipate defeat. The armies were led by Sir Arthur Wellesley (afterwards duke of Wellington) and General (afterwards Lord) Lake. Wellesley operated in the Deccan, where, in a few short months, he won the decisive victories of Assaye and Argaum, and captured Ahmadnagar. Lake's campaign in Hindustán was no less brilliant, though it has received less notice from historians. He won pitched battles at Alígarh and Láswárí, and captured the cities of Delhi and Agra, thus scattering the French troops of Sindhia, and at the same time coming forward as the champion of the Mughal emperor in his hereditary capitals. Before the year 1803 was out, both Sindhia and the Bhonslá rájá were glad to sue for peace. Sindhia ceded all claims to the territory north of the Jumna, and left the blind old emperor Sháh Alam once more under British protection. The Bhonslá forfeited Orissa to the English, who had already occupied it with a flying column, and Berar to the nizám, who gained a fresh addition by every act of complaisance to the British Government. The freebooter, Jaswant Ráo Holkar, alone remained in the field, supporting his troops by ravages through Málwá and Rájputána. The concluding years of Wellesley's rule were occupied with a series of operations against Holkar, which brought no credit on the British name. The disastrous retreat of Colonel Monson through Central India recalled memories of the convention of Wargaum, and of the destruction of Colonel

Baillie's force by Hyder Ali. The repulse of Lake in person at the siege of Bhartpur (Bhurtpore) is memorable as an instance of a British army in India having to turn back with its object unaccomplished.

The ambitious policy and the continuous wars of Lord Wellesley exhausted the patience of the court of directors at home. In 1804 Lord Cornwallis was sent out as governor-general a second time, with instructions to bring about peace at any price, while Holkar was still unsubdued, and Sindhia was threatening a fresh war. But Cornwallis was now an old man and broken down in health. Travelling up to the north-west during the rainy season, he sank and died at Gházípur, before he had been ten weeks in the country. His immediate successor was Sir George Barlow, a civil servant of the Company, who, as a *locum tenens*, had no alternative but to carry out faithfully the orders of his employers. He is charged with being, under these orders, the only governor-general who diminished the area of British territory, and with violating engagements by abandoning the Rájput chiefs to the tender mercies of Holkar and Sindhia. During his administration also occurred the mutiny of the Madras sepoys at Vellore, which, though promptly suppressed, sent a shock of insecurity throughout the empire.

Lord Minto, governor-general from 1807 to 1813, consolidated the conquests which Wellesley had acquired. His only military exploits were the occupation of the island of Mauritius, and the conquest of Java by an expedition which he accompanied in person. The condition of Central India continued to be disturbed, but Minto succeeded in preventing any violent outbreaks without himself having recourse to the sword. The Company had ordered him to follow a policy of non-intervention, and he managed to obey his orders without injuring the prestige of the British name. In his time the Indian Government first opened relations with a new set of foreign powers, by sending embassies to the Punjab, to Afghánistán, and to Persia. The ambassadors were all trained in the school of Wellesley, and formed perhaps the most illustrious trio of "politicals" that the Indian service has produced. Metcalfe was the envoy to the court of Ranjít Sinh at Lahore; Elphinstone met the sháh of Afghánistan at Peshávar; and Malcolm was despatched to Persia. If it cannot be said that any of these missions were fruitful in permanent results, at least they introduced the English to a new set of diplomatic relations, and widened the sphere of their influence.

The successor of Lord Minto was Lord Moira, better known as the marquis of Hastings, who governed India for the long period of nine years, from 1814 to 1823. This period was marked by two wars of the first magnitude, the campaigns against the Gúrkhas (Goorkhas) of Nepál, and the third and last Marhattá war. The Gúrkhas, the present ruling race in Nepál, are Hindu immigrants who claim a Rájput origin. The indigenous inhabitants, called Newars, belong to the Indo-Tibetan stock, and profess Buddhism. The sovereignty of the Gúrkhas dates only from 1767, in which year they overran the valley of Khatmandu, and gradually extended their power over all the hills and valleys of Nepál. Organized upon a sort of military and feudal basis, they soon became a terror to all their neighbours, marching east into Sikkim, west into Kumáun, and south into the Gangetic plains. In the last quarter their victims were British subjects, and at last it became imperatively necessary to check their advance. Sir George Barlow and Lord Minto had remonstrated in vain, and nothing was left to Lord Moira but to take up arms. The campaign of 1814 was little short of disastrous. After overcoming the natural difficulties of a malarious climate and precipitous hills, the sepoys were on several occasions fairly worsted by the unexpected bravery of the little Gúrkhas, whose heavy knives or *kukris* dealt terrible execution. But in 1815 General Ochterlony, who commanded the army operating by way of the Sutlej, stormed one by one the hill forts which still stud the Himálayan states, now under the Punjab government, and compelled the Nepál *darbár* to sue for peace. In the following year the same general advanced from Patná into the valley of Khatmandu, and finally dictated the terms which had before been rejected, within a few miles of the capital. By the treaty of Segauli, which defines the English relations with Nepál to the present day, the Gúrkhas withdrew on the one hand from Sikkim, and on the other from those lower ranges of the western Himálayas which have supplied the health-giving stations of Naini Tál, Massuri, and Simla. Meanwhile the condition of Central India was every year becoming more unsatisfactory. Though the great Marhattá chiefs were learning to live rather as peaceful princes than as leaders of predatory bands, the example of lawlessness they had set was being followed, and bettered in the following, by a new set of freebooters, known as the Pindhárís. As opposed to the Marhattás, who were at least a nationality bound by some traditions of a united government, the Pindhárís were merely irregular soldiers, corresponding most nearly to the free companies of mediæval Europe. Of no common race and of no common religion, they welcomed to their ranks the outlaws and broken tribes of all India,—Afgháns, Marhattás, or Játs. Their headquarters were in Málwá, but their depredations were not confined to Central India. In bands, sometimes numbering a few hundreds, sometimes many thousands, they rode out on their forays as far as Malabar and the Coromandel coast. The most powerful of the Pindhárí captains, Amír Khán, had an organized army of many regiments, and several batteries of cannon. Two other leaders, known as Chitu and Karim, at one time paid a ransom to Sindhia of £100,000. To suppress the Pindhárí hordes, who were supported by the sympathy, more or less open, of all the Marhattá chiefs, Lord Hastings (1817) collected the strongest British army that had been seen in India, numbering nearly 120,000 men, half to operate from the north, half from the south. Sindhia was overawed, and remained quiet. Amír Khán consented to disband his army, on condition of being guaranteed the possession of what is now the principality of Tank. The remaining bodies of Pindhárís were attacked in their homes, surrounded, and cut to pieces. Karim threw himself upon the mercy of the conquerors. Chitu fled to the jungles, and was killed by a tiger. In the same year (1817) as that in which the Pindhárís were crushed, and almost in the same month (November), the three great Marhattá powers at Poona, Nágpur, and Indore rose against the English. The peshwá, Báji Ráo, had long been chafing under the terms imposed by the treaty of Bassein (1802), and the subsequent treaty of Poona (1817), which riveted yet closer the chains of dependence upon the paramount power. Elphinstone, then resident at his court, foresaw what was coming and withdrew to Kirkee, whither he had ordered up a European regiment. The next day the residency was burned down, and Kirkee was attacked by the whole army of the peshwá. The attack was bravely repulsed, and the peshwá immediately fled from his capital. Almost the same plot was enacted at Nágpur, where the honour of the British name was saved by the sepoys, who defended the hill of Sítábaldi against enormous odds. The army of Holkar was defeated in the following month at the pitched battle of Mehidpur. All open resistance was now at an end. Nothing remained but to follow up the fugitives, and determine the conditions of the general pacification. In both these duties Sir John Malcolm played a prominent part. The dominions of the peshwá were annexed to the Bombay

Annexation of peshwá's dominions. presidency, and the nucleus of the present Central Provinces was formed out of the territory saved from the Pindhárís. The peshwá himself surrendered, and was permitted to reside at Bithúr, near Cawnpur, on a pension of £80,000 a year. His adopted son was the infamous Náná Sáhib. To fill the peshwá's place to some extent at the head of the Marhattá confederacy, the lineal descendant of Sivají was brought forth from obscurity, and placed upon the throne of Sátárá. An infant was recognized as the heir of Holkar, and a second infant was proclaimed rájá of Nágpur under British guardianship. At the same time the several states of Rájputána accepted the position of feudatories of the paramount power. The map of India, as thus drawn by Lord Hastings, remained substantially unchanged until the time of Lord Dalhousie. But the proudest boast of Lord Hastings and Sir John Malcolm was, not that they had advanced the *pomœrium*, but that they had conferred the blessings of peace and good government upon millions who had suffered unutterable things from Marhattá and Pindhárí tyranny.

Amherst. The marquis of Hastings was succeeded by Lord Amherst, after the interval of a few months, during which Mr Adam, a civil servant, acted as governor-general. Lord Amherst's administration lasted for five years, from 1823 to 1828. It is known in history by two prominent events, the first Burmese war and the capture of Bhartpur. For some years past the north-east frontier had been disturbed by the restlessness of the Burmese. The country that fringes the western shore of the Bay of Bengal and runs up the valley of the Irawadi, with a people of Tibeto-Chinese origin, has a history of its own, parallel to, but not altogether independent of, that of India. Tradition asserts that its early civilization was introduced from the opposite coast of Coromandel, by a people who still preserve a trace of their origin in their name of Talaing (*cf.* Telinga and Telugu). However this may be, the Buddhist religion, professed by the Burmese at the present day, certainly came direct from India at a very early date. Many waves of invasion from Siam in the south and from the wild mountains in the north have passed over the land. These conquests were marked by that wanton and wholesale barbarity which seems to characterize the Tibeto-Chinese race, but the civilization of Buddhism survived every shock, and flourished around the ancient pagodas. European travellers in the 15th century visited Pegu and Tenasserim, which they describe as flourishing marts of maritime trade. During the period of Portuguese predominance in the East, Arakan became the resort of loose European adventurers. With their help the Arakanese extended their power inland, occupied Chittagong, and (under the name of the Maghs) became the terror of the entire delta of the Ganges. About 1750 a new dynasty arose, founded by Alaungphaya or Alompra, with its capital at Ava, which still rules over Independent Burmah. The successors of Alompra, after having subjugated all Burmah, and overrun Assam, which was then an independent kingdom, began a series of encroachments upon British territory in India. As all peaceful proposals were contumeliously rejected, Lord Amherst was compelled to declare war in 1824. Little military glory could be gained by beating the Burmese, who were formidable only from the pestilential character of their country. One expedition with gunboats proceeded up the Brahmaputra into Assam; another marched by land through Chittagong into Arakan, for the Bengal sepoys refused to go by sea; a third, and the strongest, sailed from Madras direct to the mouth of the Irawadi. The war was protracted over two years. At last, after the loss of about 20,000 lives and an expenditure of £14,000,000, the king of Ava consented to sign the treaty of Yandabu, by which he abandoned all claim to Assam, and ceded the provinces of Arakan and Tenasserim, which were already in the military occupation of the British. He retained all the valley of the Irawadi, down to the sea at Rangoon.

First Burmese war.

Capture of Bhartpur. The capture of Bhartpur in Central India by Lord Combermere in 1827 wiped out the repulse which Lake had received before that city in January 1805. A disputed succession necessitated British intervention. Artillery could make little impression upon the massive walls of mud, but at last a breach was effected by mining, and the city was taken by storm, thus losing its general reputation throughout India for impregnability, which had threatened to become a political danger.

Bentinck. The next governor-general was Lord William Bentinck, who had been governor of Madras twenty years earlier at the time of the mutiny of Vellore. His seven years' rule (from 1828 to 1835) is not signalized by any of those victories or extensions of territory by which chroniclers delight to measure the growth of empire. But it forms an epoch in administrative reform, and in the slow process by which the hearts of a subject population are won over to venerate as well as dread their alien rulers. The modern history of the British in India, as benevolent administrators ruling the country with a single eye to the good of the natives, may be said to begin with Lord William Bentinck. According to the inscription upon his statue at Calcutta, from the pen of Macaulay, "He abolished cruel rites; he effaced humiliating distinctions; he gave liberty to the expression of public opinion; his constant study it was to elevate the intellectual and moral character of the nations committed to his charge." His first care on arrival in India was to restore equilibrium to the finances, which were tottering under the burden imposed upon them by the Burmese war. This he effected by reductions in permanent expenditure, amounting in the aggregate to 1½ millions sterling, as well as by augmenting the revenue from land that had escaped assessment and from the opium of Málwá. He also widened the gates by which educated natives could enter the service of the Company. Some of these reforms were distasteful to the covenanted service and to the officers of the army, but Lord William was always staunchly supported by the court of directors and by the Whig ministry at home.

Sati (suttee). His two most memorable acts are the abolition of *sati* (suttee) and the suppression of the *Thags* (Thugs). At this distance of time it is difficult to realize the degree to which these two barbarous practices had corrupted the social system of the Hindus. European research has clearly proved that the text in the *Vedas* adduced to authorize the immolation of widows was a wilful mistranslation. But the practice had been engrained in Hindu opinion by the authority of centuries, and had acquired the sanctity of a religious rite. The emperor Akbar is said to have prohibited it by law, but the early English rulers did not dare so far to violate the traditions of religious toleration. In the year 1817 no less than seven hundred widows are said to have been burned alive in the Bengal presidency alone. To this day the most holy spots of Hindu pilgrimage are thickly dotted with little white pillars, each commemorating a *sati*. In the teeth of strenuous opposition, both from Europeans and natives, Lord William carried the regulation in council on December 4, 1829, by which all who abetted *sati* were declared guilty of "culpable homicide." The honour of suppressing *Thagi* must be shared between Lord William and Captain Sleeman.

Thagi (Thuggism). *Thagi* was an abnormal excrescence upon Hinduism, in so far as the bands of secret assassins were sworn together by an oath based on the rites of the bloody goddess Kálí. Between 1826 and 1835 as many as 1562 Thags were apprehended in different parts of British India, and by the evidence of approvers the moral plague spot was gradually stamped out.

Two other historical events are connected with the administration of Lord William Bentinck. In 1833 the charter of the East India Company was renewed for twenty years, but only upon the terms that it should abandon its trade and permit Europeans to settle freely in the country. At the same time a legal or fourth member was added to the governor-general's council, who might not be a servant of the Company, and a commission was appointed to revise and codify the law. Macaulay was the first legal member of council, and the first president of the law commission. In 1830 it was found necessary to take the state of Mysore under British administration, where it has continued to the present year (1881), and in 1834 the frantic misrule of the rájá of Coorg brought on a short and sharp war. The rájá was permitted to retire to Benares, and the brave and proud inhabitants of that mountainous little territory decided to place themselves under the rule of the Company; so that the only annexation effected by Lord William Bentinck was "in consideration of the unanimous wish of the people."

calfe. Sir Charles (afterwards Lord) Metcalfe succeeded Lord William as senior member of council. His short term of office is memorable for the measure which his predecessor had initiated, but which he willingly carried into execution, for giving entire liberty to the press. Public opinion in India, as well as the express wish of the court of directors at home, pointed to Metcalfe as the most fit person to carry out the policy of Bentinck, not provisionally, but as governor-general for a full term. Party exigencies, however, led to the appointment of Lord Auckland. From that date commences a new era of war and conquest, which may be said to have lasted for twenty years. All looked peaceful until Lord Auckland, prompted by his evil genius, attempted to place Sháh Shujá upon the throne of Cabul, an attempt which ended in the gross mismanagement and annihilation of the garrison placed in that city. The disaster in Afghánistán was quickly followed by the conquest of Sind, the two wars in the Punjab, the second Burmese war, and last of all the Mutiny. Names like Gough and Napier and Colin Campbell take the places of Malcolm and Metcalfe and Elphinstone.

k- l.

han irs. For the first time since the days of the sultáns of Ghazní and Ghor, Afghánistán had obtained a national king in 1747 in the person of the Ahmad Sháh Duráni, who found his opportunity in the confusion that followed on the death of the Persian conqueror, Nádir Sháh. Before his death in 1773 Ahmad Sháh had conquered a wide empire, from Herat to Peshávar and from Kashmír to Sind. His intervention on the field of Pánipat (1761) turned back the tide of Marhattá conquest, and replaced a Mughal emperor on the throne of Delhi. But Ahmad Sháh never cared to settle down in India, and kept alternate state at his two national capitals of Cabul and Kandahár. The Duráni kings were prolific in children, who fought with one another for the succession to the death. At last, in 1826, Dost Muhammad, head of the powerful Barakzái family, succeeded in establishing himself as ruler of Cabul, with the subordinate title of amír (ameer), while two fugitive brothers of the Duráni line were living under British protection at Ludhiána, on the frontier of the Punjab.

The attention of the English Government had been directed to Afghán affairs ever since the time of Lord Wellesley, who feared that Zamán Sháh, then holding his court at Lahore, might follow in the path of Nádir Sháh, and overrun Hindustán. The growth of the powerful Síkh kingdom of Ranjít Sinh effectually dispelled any such alarms for the future. Subsequently, in 1809, while a French invasion of India was still a possibility to be guarded against, Elphinstone was sent by Lord Minto on a mission to Sháh Shujá to form a defensive alliance. Before the year was out, Sháh Shujá had been driven into exile, and a third brother, Mahmúd Sháh, was on the throne. In 1837, when the curtain rises upon the drama of English interference in Afghánistán, the usurper Dost Muhammad Barakzái was firmly established at Cabul. His great ambition was to recover Peshávar from the Síkhs; and when Captain Alexander Burnes arrived on a mission from Lord Auckland, with the ostensible object of opening trade, the Dost was willing to promise everything, if only he could get Peshávar. But Lord Auckland had another and more important object in view. At this time the Russians were advancing rapidly in Central Asia, and a Persian army, not without Russian support, was besieging Herat, the traditional bulwark of Afghánistán on the east. A Russian envoy was at Cabul at the same time as Burnes. The latter was unable to satisfy the demands of Dost Muhammad in the matter of Peshávar, and returned to India unsuccessful. Lord Auckland forthwith resolved upon the hazardous plan of placing a more subservient ruler upon the throne of Cabul. Sháh Shujá, one of the two exiles at Ludhiána, was selected for the purpose. At this time both the Punjab and Sind were independent kingdoms. Sind was the less powerful of the two, and therefore a British army escorting Sháh Shujá made its way by that route to enter Afghánistán through the Bolán Pass. Kandahár surrendered, Ghazní was taken by storm, Dost Muhammad fled across the Hindu Kush, and Sháh Shujá was triumphantly led into the Bala Hissár at Cabul in August 1839. During the two years that followed Afghánistán remained in the military occupation of the British. The catastrophe occurred in November 1841, when Sir Alexander Burnes was assassinated in the city of Cabul. The troops in the cantonments were then under the command of General Elphinstone (not to be confounded with the civilian Mountstuart Elphinstone), with Sir William Macnaghten as chief political adviser. Elphinstone was an old man, unequal to the responsibilities of the position. Macnaghten was treacherously murdered at an interview with the Afghán chief, Akbar Khán, eldest son of Dost Muhammad. After lingering in their cantonments for two months, the British army set off in the depth of winter to find its way back to India through the passes. When they started they numbered 4000 fighting men, with 12,000 camp followers. A single survivor, Dr Brydon, reached the friendly walls of Jalálábád, where Sale was gallantly holding out. The rest perished in the defiles of Khurd, Cabul, and Jagdalak, either from the knives and matchlocks of the Afgháns or from the effects of cold. A few prisoners, mostly women, children, and officers, were considerately treated by the orders of Akbar Khán.

First Afghan war.

Within a month after the news reached Calcutta, Lord Auckland had been superseded by Lord Ellenborough, whose first impulse was to be satisfied with drawing off in safety the garrisons from Kandahár and Jalálábád. But bolder counsels prevailed. Pollock, who was marching straight through the Punjab to relieve Sale, was ordered to penetrate to Cabul, while Nott was only too glad not to be forbidden to retire from Kandahár through Cabul. After a good deal of fighting, the two English forces met at their common destination in September 1842. The great *bázár* at Cabul was blown up with gunpowder, to fix a stigma upon the city; the prisoners were recovered; and all marched back to India, leaving Dost Muhammad to take undisputed possession of his throne. The drama closed with a bombastic proclamation from Lord Ellenborough, who had caused the gates from the tomb of Mahmúd of Ghazní to be carried back as a memorial of "Somnáth revenged." Ellenborough.

Lord Ellenborough, who loved military display, had his tastes gratified by two more wars. In 1843 the Mahometan rulers of Sind, known as the "meers" or amírs, whose only

Conquest of Sind. fault was that they would not surrender their independence, were crushed by Sir Charles Napier. The victory of Miáni, in which 3000 British troops defeated 20,000 Baluchís, is perhaps the most brilliant feat of arms in Indian history; but an honest excuse can scarcely be found for the annexation of the country. In the same year a disputed succession at Gwalior, fomented by feminine intrigue, resulted in an outbreak of the overgrown army which the Sindhia family had been allowed to maintain. Peace was restored by the battles of Maharájpur and Punneah, at the former of which Lord Ellenborough was present in person.

Hardinge. In 1844 Lord Ellenborough was recalled by the court of directors, who differed from him on many points of administration, and distrusted his erratic genius. He was succeeded by Sir Henry (afterwards Lord) Hardinge, who had served through the Peninsular War and had lost a hand at Ligny. It was felt on all sides that a trial of strength between the British and the Síkhs was at hand.

Rise of Síkhs. The Síkhs were not a nationality like the Marhattás, but a religious sect bound together by the additional tie of military discipline. They trace their origin to one Nának, an excellent and successful preacher, who was born in the neighbourhood of Lahore in the latter half of the 15th century, before the arrival of either Mughals or Portuguese in India. Nának was a religious reformer, like others that arose in the country about that time, who preached the abolition of caste, the unity of the Godhead, and the obligation of leading a pure life. From Nának ten *gurus* or apostles are traced down to Govind Sinh in 1708, with whom the succession stopped. Suffering continual persecution from the ruling Mahometans, which culminated in the reign of Aurangzeb, the Síkh religion maintained itself with extraordinary tenacity. At last the downfall of the Mughal empire transformed it into a territorial power, which possessed the only organization remaining in the Punjab. Even before the rise of Ranjit Sinh, offshoots from the Síkh *misls* or confederacies, each led by its elected *sardár*, had carved out for themselves feudal principalities along the banks of the Sutlej, some of which have endured to the present day. Ranjít Sinh, the founder of the Síkh kingdom, was born in 1780. In his twentieth year he obtained the appointment of governor of Lahore from the Afghán emperor, and from that time he set himself to the task of basing a personal despotism upon the religious fanaticism of the Síkhs. The *khálsá* or "the liberated" were organized into an army under European officers, which for steadiness and religious fervour has had no parallel since the "ironsides" of Cromwell. From Lahore as his capital he extended his conquests south to Múltán, west to Pesháwar, and north to Kashmír. On the east side alone he was hemmed in by the Sutlej, up to which river the authority of the British Government was advanced in 1804. Till his death in 1839 Ranjít Sinh was ever loyal to the engagements which he had entered into with Metcalfe in 1809. But he left no son capable of wielding his sceptre. Lahore was torn by dissensions between rival generals, ministers, and queens. The only strong power was the army of the *khálsá*, which since the disaster in Afghánistán burned to measure its strength with the British sepoys. The French generals, Avitable and Court, were foolishly ousted, and the supreme military command was vested in a series of *pancháyats* or elective committees of five.

Síkh campaign. In 1845 the Síkh army, numbering 60,000 men with 150 guns, crossed the Sutlej and invaded British territory. Sir Hugh Gough, the commander-in-chief, together with the governor-general, hurried up to the frontier. Within three weeks four pitched battles were fought, at Moodkee, Ferozshah, Aliwál, and Sobráon. The British loss on each occasion was heavy; but by the last victory the Síkhs were fairly driven into and across the Sutlej, and Lahore surrendered to the British. By the terms of peace then dictated the infant son of Ranjít, Dhulip Sinh, was recognized as rájá; the Jalandhar Doáb, or tract between the Sutlej and the Rávi, was annexed; the Síkh army was limited to a specified number; Major Henry Lawrence was appointed to be resident at Lahore; and a British force was detailed to garrison the Punjab for a period of eight years. Sir H. Hardinge received a peerage, and returned to England in 1848.

Dalhousie. Lord Dalhousie succeeded, whose eight years' administration (from 1848 to 1856) was more pregnant of results than that of any governor-general since Clive. Though professedly a man of peace, he was compelled to fight two wars, in the Punjab and in Burmah. These both ended in large acquisitions of territory, while Nágpur, Oudh, and several minor states also came under British rule. But Dalhousie's own special interest lay in the advancement of the moral and material condition of the country. The system of administration carried out in the conquered Punjab by the two Lawrences and their assistants is probably the most successful piece of difficult work ever accomplished by Englishmen. British Burmah has prospered under their rule scarcely less than the Punjab. In both cases Lord Dalhousie deserves a large share of the credit. No branch of the administration escaped his reforming hand. He founded the public works department, to pay special attention to roads and canals. He opened the Ganges Canal, still the largest work of the kind in the country, and he turned the sod of the first Indian railway. He promoted steam communication with England *via* the Red Sea, and introduced cheap postage and the electric telegraph. It is Lord Dalhousie's misfortune that these benefits are too often forgotten in the vivid recollections of the Mutiny, which avenged his policy of annexation.

Second Síkh war. Annexation of Punjab. Lord Dalhousie had not been six months in India before the second Sikh war broke out. Two British officers were treacherously assassinated at Múltán. Unfortunately Henry Lawrence was at home on sick leave. The British army was not ready to act in the hot weather, and, despite the single-handed exertions of Lieutenant (afterwards Sir Herbert) Edwardes, this outbreak of fanaticism led to a general rising. The *khálsá* army again came together, and once more fought on even terms with the British. On the fatal field of Chilianwála, which patriotism prefers to call a drawn battle, the British lost 2400 officers and men, besides four guns and the colours of three regiments. Before reinforcements could come out from England, with Sir Charles Napier as commander-in-chief, Lord Gough had restored his own reputation by the crowning victory of Guzerat, which absolutely destroyed the Síkh army. Múltán had previously fallen; and the Afghán horse under Dost Muhammad, who had forgotten their hereditary antipathy to the Síkhs in their greater hatred of the British name, were chased back with ignominy to their native hills. The Punjab henceforth became a British province, supplying a virgin field for the administrative talents of Dalhousie and the two Lawrences. Rájá Dhulip Sinh received an allowance of £50,000 a year, on which he retired as a country gentleman to Norfolk in England. The first step in the pacification of the Punjab was a general disarmament, which resulted in the delivery of no less than 120,000 weapons of various kinds. Then followed a settlement of the land tax, village by village, at an assessment much below that to which it had been raised by Síkh exactions, and the introduction of a loose but equitable code of civil and criminal procedure. Roads and canals were laid out by Colonel Robert Napier (afterwards Lord Napier of Magdala); and the security of British peace and the personal influence of British officers were felt to the furthest corners of the province. Thus it happened that, when the Mutiny broke out in 1857, the Punjab remained not only quiet but loyal, after only eight years' experience of English rule; while the North-Western Provinces, which had been British territory for more than half a century, rose in rebellion.

Second Burmese war. The second Burmese war of 1852 was caused by the ill-treatment of European merchants at Rangoon, and the insolence offered to the captain of a frigate who had been sent to remonstrate. The whole valley of the Irawadi, from Rangoon to Prome, was occupied in a few months, and, as the king of Ava refused to treat, it was annexed, under the name of Pegu, to the provinces of Arakan and Tenasserim, which had been acquired in 1826. Since annexation the inhabitants of

Rangoon have increased tenfold in number, and that port now ranks third in British India, being surpassed only by Calcutta and Madras. Lord Dalhousie's dealings with the feudatory states of India can only be rightly appreciated as part of his general policy. That rulers only exist for the good of the ruled was his supreme axiom of government, of which he gave the most conspicuous example by the practice of his own daily life. That British administration was better for the people than native rule followed from this axiom as a necessary corollary. He was thus led to regard native chiefs from somewhat the same point of view as the Scotch regarded the hereditary jurisdictions after 1745, as mischievous anomalies, to be abolished by every means practicable. Good faith must be kept with rulers on the throne and with their legitimate heirs, but no false sentiment should preserve dynasties that had forfeited all consideration by years of accumulated misrule, or prolong those that had no natural successor. The "doctrine of lapse" was merely a special application of these principles, though complicated by the theory of adoption. It has never been doubted that, according to Hindu private law, an adopted son entirely fills the place of a natural son, whether to perform the religious obsequies of his father or to inherit his property. In all respects he continues the *persona* of the deceased. But it was argued that the succession to a throne stood upon a different footing. The paramount power could not recognize such a right, which might be used as a fraud to hand over the happiness of millions to a base-born impostor. Here came in the maxim of "the good of the governed." The material benefits to be conferred through British administration surely weighed heavier in the scale than a superstitious and frequently fraudulent fiction of inheritance. The first state to escheat to the British Government in accordance with these principles was Sátárá, which had been reconstituted by Lord Hastings on the downfall of the peshwá in 1818. The last direct representative of Sivají died without a male heir in 1848, and his deathbed adoption was set aside. In the same year the Rájput state of Karauli was saved by the interposition of the court of directors, who drew a fine distinction between a dependent principality and a protected ally. In 1833 Jhánsi suffered the same fate as Sátárá. But the most conspicuous application of the doctrine of lapse was the case of Nágpur The last of the Bhonslás, a dynasty older than the British Government itself, died without a son, natural or adopted, in 1853. That year also saw British administration extended to the Berars, or the assigned districts which the nizám of Hyderabad was induced to cede as a territorial guarantee for the subsidies which he perpetually kept in arrear Three more distinguished names likewise passed away in 1853, though without any attendant accretion to British territory. In the extreme south the titular nawáb of the Carnatic and the titular rájá of Tanjore both died without heirs. Their rank and their pensions died with them, though compassionate allowances were continued to their families. In the north of India, Báji Ráo, the ex-peshwá who had been dethroned in 1818, lived on till 1853 in the enjoyment of his annual pension of £80,000. His adopted son, Nána Sáhib, inherited his accumulated savings, but could obtain no further recognition.

Annexation of Oudh.

The annexation of the province of Oudh is to be defended on very different grounds. Ever since the nawáb wazír, Shujá-ud-Daulá, received back his forfeited territories from the hands of Lord Clive in 1765, the very existence of Oudh as an independent state had depended only upon the protection of British bayonets. Thus, preserved alike from foreign invasion and from domestic rebellion, the long line of subsequent nawábs had given way to that neglect of public affairs and those private vices which naturally flow from irresponsible power. Their only redeeming virtue was steady loyalty to the British Government. Oudh has been called "the Garden of India" by an author[1] who endeavours to show that the evils of native rule were never so black as they have been painted. But at any rate that fair corner of the Gangetic basin, which now supports a denser population than any equal area on the surface of the globe, had been groaning for generations under anarchy for which each successive governor-general admitted that he was partly responsible. Warning after warning had been given to the nawábs (who had assumed the title of sháh or king since 1819) that they must put their house in order. What the benevolent Bentinck and the soldierly Hardinge had only threatened was reserved for Lord Dalhousie, who united honesty of purpose with decision of character. In this determination he had the full support of the court of directors at home. In 1856, the last year of his rule, he issued orders to General (afterwards Sir James) Outram, then resident at the court of Lucknow, to assume the direct administration of Oudh, on the ground that "the British Government would be guilty in the sight of God and man, if it were any longer to aid in sustaining by its countenance an administration fraught with suffering to millions." The king, Wájid Alí, bowed to irresistible force, though he ever refused to recognize the justice of his deposition. After a mission to England, by way of protest and appeal, he settled down in the pleasant suburb of Garden Reach near Calcutta, where he lived in the enjoyment of a pension of £120,000 a year. Oudh was thus annexed without a blow; but it may be doubted whether the one measure of Lord Dalhousie upon which he looked back himself with the clearest conscience was not the very one that most alarmed native public opinion.

The marquis of Dalhousie resigned office in March 1856, being then only forty-four years of age; but he carried home with him the seeds of a lingering illness which resulted in his death in 1860. Excepting Cornwallis, he was the first, though by no means the last, of English statesmen who have fallen victims to their devotion to India's needs. He was succeeded by his friend, Lord Canning, who, at the farewell banquet in England given to him by the court of directors, uttered these prophetic words: "I wish for a peaceful term of office. But I cannot forget that in the sky of India, serene as it is, a small cloud may arise, no larger than a man's hand, but which, growing larger and larger, may at last threaten to burst and overwhelm us with ruin." In the following year the sepoys of the Bengal army mutinied, and all the valley of the Ganges from Patná to Delhi rose in open rebellion.

Canning.

Mutiny.

The various motives assigned for the Mutiny appear inadequate to the European mind. The truth seems to be that native opinion throughout India was in a ferment, predisposing men to believe the wildest stories, and to act precipitately upon their fears. The influence of panic in an Oriental population is greater than might be readily believed. In the first place, the policy of Lord Dalhousie, exactly in proportion as it had been dictated by the most honourable considerations, was utterly distasteful to the native mind. Repeated annexations, the spread of education, the appearance of the steam engine and the telegraph wire, all alike revealed a consistent determination to substitute an English for an Indian civilization. The Bengal sepoys, especially, thought that they could see into the future farther than the rest of their countrymen. Nearly all men of high caste, and many of them recruited from Oudh, they dreaded tendencies which they deemed to be denationalizing, and they knew at first hand what annexation

[1] *The Garden of India, or Chapters on Oudh History and Affairs*, by H. C. Irwin, London, 1880.

meant. They believed it was by their prowess that the Punjab had been conquered, and all India was held quiet. The numerous dethroned princes, their heirs and their widows, were the first to learn and take advantage of the spirit of disaffection that was abroad. They had heard of the Crimean war, and were told that Russia was the perpetual enemy of England. They had money in abundance with which they could buy the assistance of skilful intriguers. They had everything to gain, and nothing to lose, by a revolution.

In this critical state of affairs, of which the Government had no official knowledge, a rumour ran through the cantonments of the Bengal army that cartridges had been served out greased with the fat of animals unclean alike to Hindu and Mahometan. After this, nothing could quiet the minds of the sepoys. Fires occurred nightly in the native lines; officers were insulted by their men; all confidence was gone, and only the form of discipline remained. On the afternoon of Sunday, May 10, 1857, the sepoys at Meerut (Mirath) broke into open mutiny. Their first mad frenzy marked by its excess the change from their usually quiet manners and orderly habits. They broke into the jail, and then ran through the cantonments, cutting down every European they met. At last they streamed off to the neighbouring city of Delhi, to stir up the native garrison and the criminal population of that great city, and to place themselves under the authority of the discrowned Mughal emperor. Meerut was the largest military station in India, with a strong European garrison of foot, horse, and guns, sufficient to overwhelm the mutineers before ever they reached Delhi. But just as the sepoys acted in irrational panic, so did British officers in but too many cases act with equally irrational indecision. The news of the outbreak was telegraphed to Delhi, and nothing more was done that night. The next morning the Mahometans of Delhi rose, and all that the Europeans there could do was to blow up the magazine. A rallying centre and a traditional name was thus given to the revolt, which forthwith spread like wildfire through all the North-Western Provinces and Oudh down into Lower Bengal. The same narrative must suffice for all, though each episode has its own peculiar story of sadness and devotion. The sepoys rose on their officers, without warning, and sometimes after protestations of fidelity. The Europeans, or persons of Christian faith, were massacred, sometimes also women and children. The jail was broken open, the treasure plundered, and then all marched off to some centre of revolt, to join in what had now become a national war. Only in the Punjab were the sepoys anticipated by the stern measures of repression and disarmament adopted by Sir John Lawrence and his lieutenants, among whom Edwardes and Nicholson were conspicuous. The Síkh population never wavered. Crowds of willing recruits came down from the Afghán hills. And thus the Punjab, instead of being itself a source of danger, was able to furnish a portion of its own garrison for the siege of Delhi. In Lower Bengal most of the sepoys mutinied, and then dispersed in different directions. The native armies of Madras and Bombay remained true to their colours. In Central India the contingents of many of the great chiefs sooner or later joined the rebels, but the Mahometan state of Hyderabad was kept loyal by the authority of its able minister Sir Sálar Jang.

Loyalty of Síkhs

The main interest of the sepoy war gathers round the three cities of Cawnpur, Lucknow, and Delhi. The cantonments at Cawnpur contained the largest native garrison in India; and in the immediate neighbourhood, at Bithúr, was the palace of Dandhu Panth, the disinherited heir of the last peshwá, whose more familiar appellation of Nána Sáhib will ever be handed down to the infamy of history. At first the Nána was profuse in his professions of loyalty, but as soon as the sepoys mutinied he put himself at their head, and was proclaimed peshwá of the Marhattás. The Europeans at Cawnpur, who numbered more women and children than fighting men, shut themselves up in improvised entrenchments, where they sustained a siege for nineteen days under the sun of a tropical June. At last, trusting to a safe conduct from the Nána as far as Allahábád, they surrendered their position, and to the number of four hundred and fifty individuals embarked in boats on the Ganges. Forthwith a murderous fire was opened upon them from the river bank. Only a single boat escaped, and but four men, who swam across to the protection of a friendly rájá, ultimately survived to tell the tale. The rest of the men were massacred on the spot; the women and children, numbering one hundred and twenty-five, were reserved for the same fate a few days later, when the avenging army of Havelock was at hand. Sir Henry Lawrence, the chief commissioner of Oudh, had foreseen the coming storm with a prophetic eye. He had fortified and provisioned the residency at Lucknow in good time, and thither he retired with all the European inhabitants and a weak British regiment on July 2. Two days later he was mortally wounded by a shell. But his example inspired the little garrison to hold out under unparalleled hardships and against enormous odds, until relieved by Havelock and Outram on September 25. But the relieving force was itself invested by fresh swarms of rebels, and it was not till November that Sir Colin Campbell, afterwards Lord Clyde, cut his way into Lucknow, and effected the final deliverance of the garrison. The siege of Delhi began on June 8, just one month after the original outbreak at Meerut. Siege in the proper sense of the word it was not, for the British army, encamped on the historic ridge, never exceeded 8000 men, while the rebels within the walls were more than 30,000 strong. In the middle of August Nicholson arrived with a reinforcement from the Punjab, but his own encouraging presence was more valuable than the reinforcement he brought. On September 14 the assault was delivered, and after six days' desperate fighting in the streets Delhi was again won. Nicholson fell at the head of the storming party. Hodson, the intrepid leader of a corps of irregular horse, hunted down and brought in as prisoner the old Mughal emperor, Bahádur Sháh, and then in cold blood shot down the emperor's sons with his own hand. After the fall of Delhi and the final relief of Lucknow the war loses its dramatic interest, though fighting went on in various parts of the country for eighteen months longer. The population of Oudh and Rohilkhand, stimulated by the presence of the begum of Oudh, the nawáb of Bareilly, and Nána Sáhib himself, had joined the mutinous sepoys *en masse*. In this quarter of India alone, it was the revolt of a people rather than the mutiny of an army that had to be quelled. Sir Colin Campbell in person conducted the campaign in Oudh, which lasted through two cold seasons. Valuable assistance was lent by Sir Jang Bahádur of Nepál, at the head of a numerous army of Gúrkhas. Town after town was occupied, fort after fort was stormed, until at length the last gun had been recaptured and the last fugitive had fled across the frontier by January 1859 In the meanwhile Sir Hugh Rose (afterwards Lord Strathnairn), with another army from Bombay, was conducting an equally brilliant campaign in Central India. His most formidable antagonists were the disinherited rání of Jhánsí, and Tántia Topí, whose military talent had previously inspired Nána Sáhib with all the capacity for resistance that he ever displayed. The rání died fighting bravely at the head of her troops in June 1858; Tántiá Topí, after doubling backwards and forwards through Central India, was at last betrayed and run down in April 1859.

Suppr sion o mutin

The Mutiny sealed the fate of the East India Company, after a life of more than two and a half centuries.

[...]y's [...]ters. The Company received its original charter of incorporation from Elizabeth in 1600. Its political powers, and the constitution of the Indian Government, were derived from the Regulating Act of 1773, passed by the ministry of Lord North. By that statute the governor of Bengal was raised to the rank of governor-general; and, in conjunction with his council of four other members, he was entrusted with the duty of superintending and controlling the governments of Madras and Bombay so far as regarded questions of peace and war; a supreme court of judicature was appointed at Calcutta, to which the judges were appointed by the crown; and a power of making rules, ordinances, and regulations was conferred upon the governor-general and his council. Next came the India Bill of Pitt (1784), which founded the board of control, strengthened the supremacy of Bengal over the other presidencies, and first authorized the historic phrase "governor-general-in-council." The Act which abolished the Company's monopoly of trade (1833) also introduced several reforms into the constitution of the Indian Government, and added to the council an additional member, who might not be chosen from among the Company's servants, and was entitled to be present only at meetings for making laws and regulations; it gave the authority of Acts of Parliament to the laws and regulations so made, subject to the disallowance of the court of directors; it appointed a law commission; and it gave the governor-general-in-council a control over the other presidencies in all points relating to the civil or military administration. The charter of the Company was renewed for the last time in 1853, not for a definite period of years, but only for so long as parliament should ordain. On this occasion the number of directors was reduced, and their patronage as regards appointments to the civil service was taken away, to make room for the principle of open competition.

[...]nsfer [...]rown. The Act for the better government of India (1858), which finally transferred the entire administration from the Company to the crown, was not passed without an eloquent protest from the directors, nor without acrimonious party discussion in parliament. It enacts that India shall be governed by, and in the name of, the sovereign of England through one of the principal secretaries of state, assisted by a council of fifteen members. The governor-general received the new title of viceroy. The European troops of the Company, numbering about 24,000 officers and men, were amalgamated with the royal service, and the Indian navy was abolished. By the Indian Councils Act (1861) the governor-general's council and also the councils at Madras and Bombay were augmented by the addition of non-official members, either natives or Europeans, for legislative purposes only; and by another Act passed in the same year high courts of judicature were constituted out of the existing supreme courts at the presidency towns.

It fell to the lot of Lord Canning both to suppress the Mutiny and to introduce the peaceful revolution that followed. As regards his execution of the former part of his duties, it is sufficient to say that he preserved his equanimity undisturbed in the darkest hours of peril, and that the strict impartiality of his conduct incurred alternate praise and blame from the fanatics on either side The epithet then scornfully applied to him of "Clemency" Canning is now remembered only to his honour. On November 1, 1858, at a grand *darbár* held at Allahábád the royal proclamation was published which announced that the queen had assumed the government of India. This document, which has been called the Magna Charta of the Indian people, went on to explain the policy of political justice and religious toleration which it was her royal pleasure to pursue, and granted an amnesty to all except those who had directly taken part in the murder of British subjects. Peace was proclaimed throughout India on July 8, 1859; and in the following cold weather Lord Canning made a viceregal progress through the upper provinces, to receive the homage of loyal princes and chiefs, and to guarantee to them the right of adoption. The suppression of the Mutiny increased the debt of India by about 40 millions sterling, and the military changes that ensued augmented the annual expenditure by about 10 millions. To grapple with this deficit, Mr James Wilson was sent out from the treasury as financial member of council. He reorganized the customs system, imposed an income tax and licence duty, and created a state paper currency. The penal code, originally drawn up by Macaulay in 1837, passed into law in 1860, together with a code of civil and criminal procedure.

Recent administration. Lord Canning left India in March 1862, and died before he had been a month in England. His successor, Lord Elgin, only lived till November 1863, when he too fell a victim to the excessive work of the governor-generalship, dying at the Himálayan station of Dharmsálá, where he lies buried. He was succeeded by Sir John Lawrence, the saviour of the Punjab. The chief incidents of his administration were the Bhután war and the terrible Orissa famine. Lord Mayo, who succeeded him in 1869, carried on the permanent British policy of moral and material progress with a special degree of personal energy. The Ambálá (Umballa) darbár, at which Shere Ali was recognized as amír of Afghánistán, though in one sense merely the completion of what Lord Lawrence had begun, owed much of its success to the personal influence of Lord Mayo himself. The same quality, combined with sympathy and firmness, stood him in good stead in all his dealings both with native chiefs and European officials. His example of hard work stimulated all to their best. While engaged in exploring with his own eyes the furthest corners of the empire, he fell by the hand of an assassin in the convict settlement of the Andaman Islands in 1872. His successor was Lord Northbrook, whose ability showed itself chiefly in the department of finance. During the time of his administration a famine in Lower Bengal in 1874 was successfully obviated by Government relief and public works, though at an enormous cost; the gáikwár of Baroda was dethroned in 1875 for misgovernment and disloyalty, while his dominions were continued to a nominated child of the family; and the Prince of Wales made a tour through the country in the cold weather of 1875–76. Lord Lytton followed Lord Northbrook in 1876. On January 1, 1877, Queen Victoria was proclaimed Empress of India at a *dárbár* of unequalled magnificence, held on the historic "ridge" overlooking the Mughal capital of Delhi. But, while the princes and high officials of the country were flocking to this gorgeous scene, the shadow of famine was already darkening over the south of India.

Famine 1876-78. Both the monsoons of 1876 had failed to bring their due supply of rain, and the season of 1877 was little better. The consequences of this prolonged drought, which extended from the Deccan to Cape Comorin, and subsequently invaded northern India, were more disastrous than any similar calamity since the introduction of British rule. Despite unparalleled importations of grain by sea and rail, despite the most strenuous exertions of the Government, which incurred a total expenditure on this account of 11 millions sterling, the loss of life from actual starvation and its attendant train of diseases was lamentable. The total number of deaths from disease and want in the distressed tracts in excess of the normal mortality for the two years 1876–78 is estimated to have raised the death-rate by 40 per cent., or 5¼ millions. In the autumn of 1878 the affairs of Afghánistán again forced themselves into notice. Shere Ali, the amír, who had been hospitably entertained by Lord Mayo, was found to be favouring Russian intrigues. A British embassy was refused admittance to the country, while a Russian mission was received with honour. This led to a declaration of war. British armies advanced by three routes,—the Khaibar (Khyber), the Kuram, and the Bolán, and without much opposition occupied the inner entrances of the passes. Shere Ali fled to Afghán Turkestán, and there died. A treaty was entered into with his son, Yákub Khán, at Gandamak, by which the British frontier was advanced to the crests or further sides of the passes, and a British officer was admitted to reside at Cabul. Within a few months the British resident, Sir Louis Cavagnari, was treacherously attacked and massacred, together with his escort, and a second war became necessary. Yákub Khán abdicated, and was deported to India; Cabul was occupied in force, and an Afghán chief of the Duráni line was placed in the government of Kandahár with the title of wálí. At that crisis of affairs a general election in England resulted in a defeat of the ministry. Lord Lytton resigned with the Conservative ministry, and the marquis of Ripon was nominated as his successor in 1880. Since then, a British brigade received a defeat between Kandahár and the Helmand river from the Heráti army of Ayúb Khán, a defeat promptly and completely retrieved by the brilliant march of General Sir Frederick Roberts from Cabul to Kandahár, and by the total rout of Ayúb Khán's army on September 1, 1880. Abdurrahman Khán, the eldest male representative of the stock of Dost Muhammad, has now been recognized as amír of Cabul.

Afghan campaigns, 1878-80.

Governors-General of India under the East India Company, 1765–1858.

1765. Lord Clive.
1767. Harry Verelst.
1769. John Cartier.
1772. Warren Hastings.
1786. Lord (afterwards Marquis) Cornwallis.
1793. Sir John Shore (Lord Teignmouth).
1798. Sir Alured Clarke (*pro tem.*).
1798. Lord Mornington (Marquis Wellesley).
1805. Lord Cornwallis again.
1805. Sir George Barlow (*pro tem.*).
1806. Earl of Minto.
1813. Earl of Moira (Marquis of Hastings).
1823. John Adam (*pro tem.*).
1823. Lord Amherst.
1828. Lord William Cavendish Bentinck.
1835. Sir Charles Metcalfe (Lord Metcalfe).
1836. Lord Auckland.
1842. Earl of Ellenborough.
1844. Viscount Hardinge.
1848. Earl (afterwards Marquis) of Dalhousie.
1856. Earl Canning.

Viceroys of India under the Crown, 1858–1881.

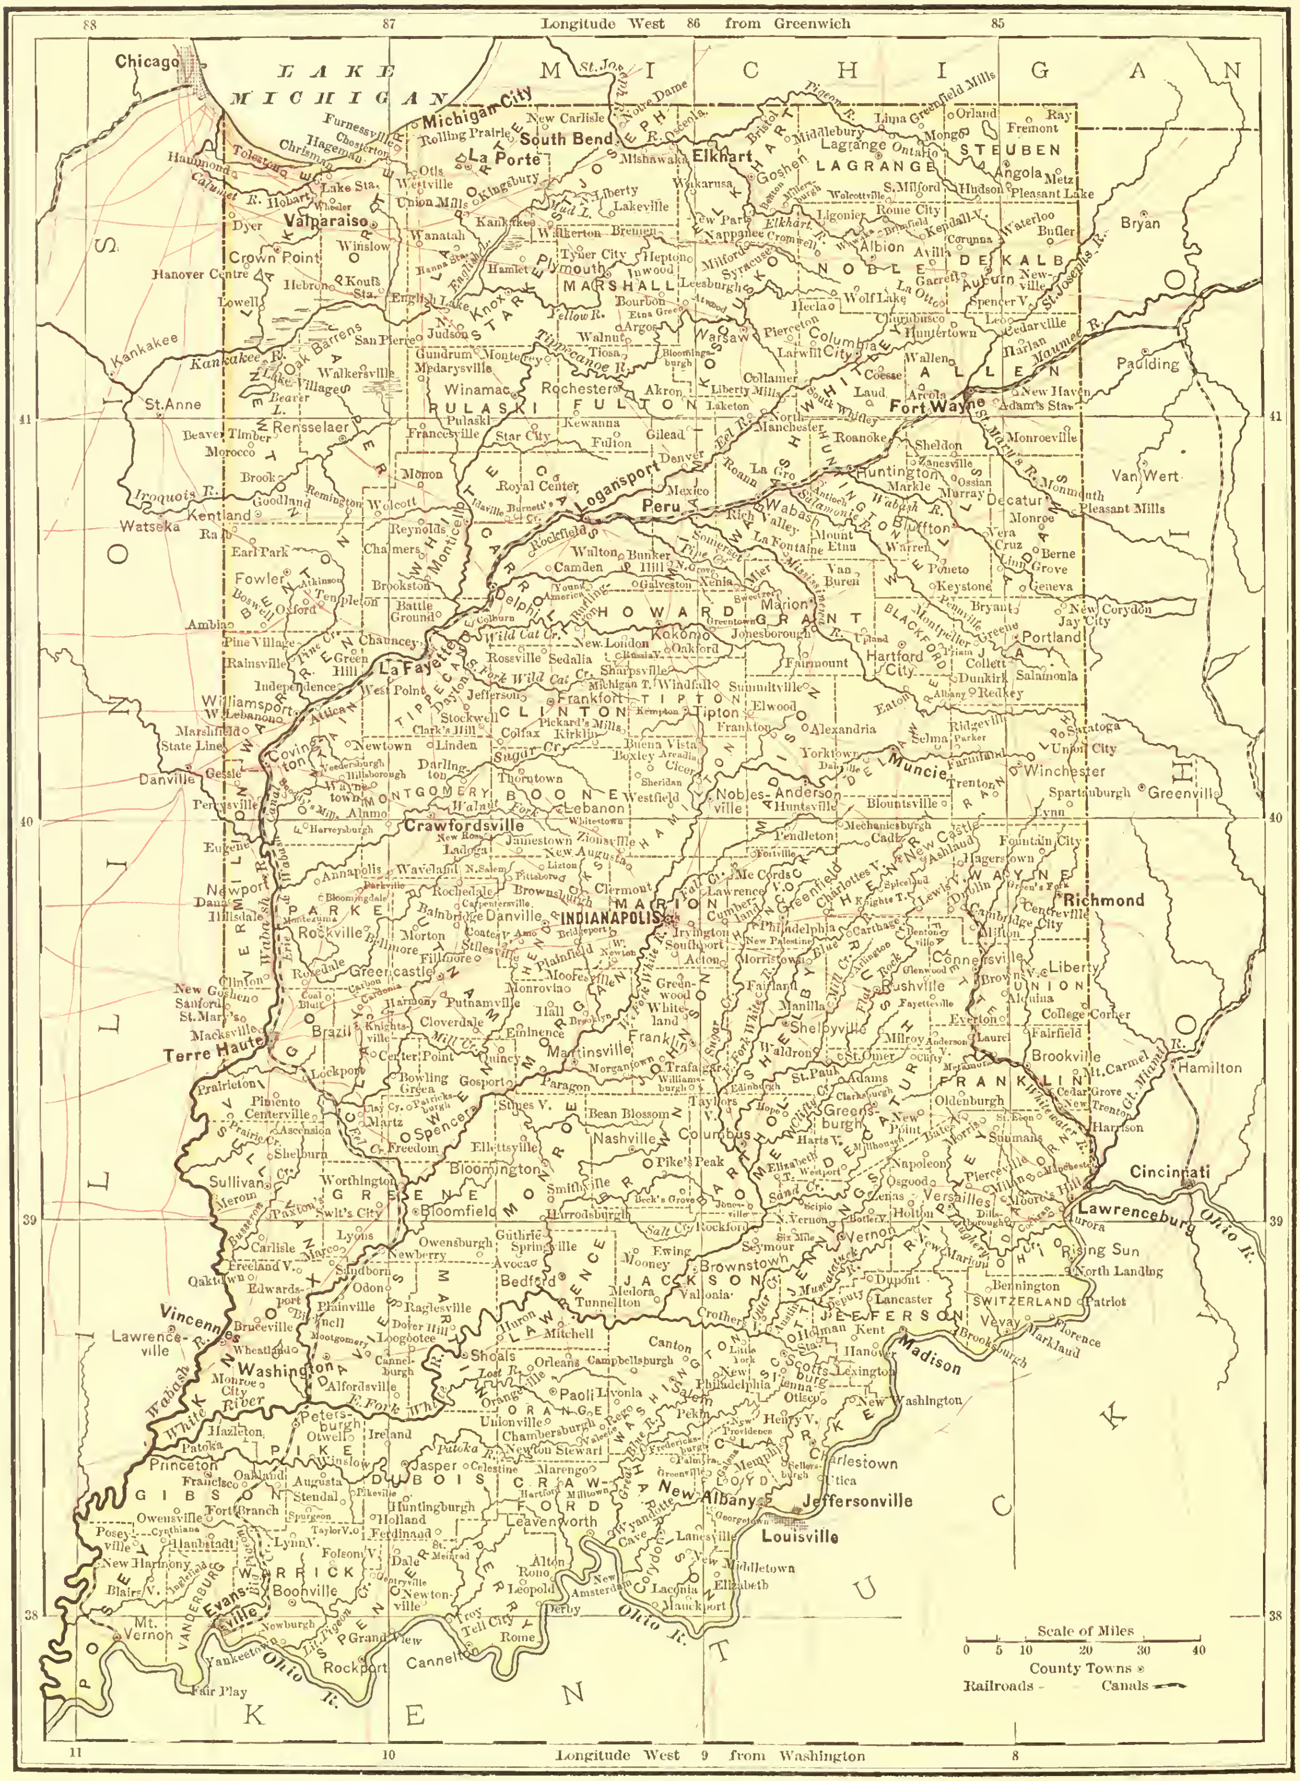
1858. Earl Canning.
1862. Earl of Elgin.
1864. Sir John Lawrence (Lord Lawrence).
1869. Earl of Mayo.
1872. Lord Northbrook.
1876. Lord Lytton.
1880. Marquis of Ripon.

Bibliography of India.—(1) History. Orme's *Indostan.* Wilson's edition of Mill's *History of India.* 9 vols., 1840-48, is still the standard work on the general history cf India; but it is practically superseded, with regard to special periods, by a number of less known works. Mountstuart Elphinstone's *History of India* (Professor Cowell's edition, 1866) deals with the Mahometan period. Sir Henry Elliot's *History of India* (8 vols., 1867–77) treats of the earlier centuries of that period as told by the native historians. Mr Grant-Duff's *History of the Marhattás*, Cunningham's *History of the Sikhs*, Wilk's *History of Mysore*, and Dr Buchanan's *Journey through Malabar and Kanara* are the best general works with regard to the native history of southern India. Todd's *Rájásthán* occupies the same position with reference to the great tract of which it treats. But in these departments also the process of subdivision has taken place, and different periods or aspects are now treated elaborately by specialists. (2) Aitchison's *Treaties and Engagements*, 7 vols., require a place by themselves. (3) The following are the leading works on the various periods, provinces, and races:—M'Crindle's *Ancient India of Megasthenes and Arrian*, and his *Navigation of the Erythræan Sea*; Dr J. Muir's *Original Sanskrit Texts*, 5 invaluable vols., 1868–72; Weber's *History of Indian Literature*, 1878; Professor Max Müller's *History of Sanskrit Literature*, and various works and essays; Professor Dowson's *Classical Dictionary of Hindu Mythology*. 1879; Sherring's *Hindu Tribes and Castes*; Fergusson's *Tree and Serpent Worship. Indian Architecture, Cave Temples*, &c.; the *Reports* of the Archæological Survey, by General Cunningham and Mr Burgess; Beame's edition of Sir H. Elliot's *Races of India*; Ward's *Hindus*; Abbé Dubois's *Manners and Customs of India*; Bishop Heber's *Journey*; Mrs Manning's *Ancient and Mediæval India*; Rájendra Lála Mitra's *Orissa*, and series of valuable antiquarian works; General Cunningham's *Ancient Geography of India*, 1871; B. H. Hodgson's *Essays on Indian Subjects*, 2 vols., 1880, and other works, specially on Nepál and Tibet; Bishop Caldwell's *Comparative Grammar of the Dravidian Languages*, the standard authority on southern India; Colonel Dalton's *Ethnology of Bengal*; R. Cust's *Linguistic and Oriental Essays*, 1880; H. H. Wilson's great series of works; Sir Henry Summer Maine's *Village Communities*; Birdwood's *Indian Arts.* (4) Works of a more local character:—*The Statistical Account of Bengal and Assam*, with the Gazetteers or District Manuals for Bombay, Madras, the North-West, the Central Provinces, Rájputána, Mysore, British Burmah, Ajmír, and other provinces; Colonel Malleson's and Mr Mackay's works on the native states and princes; Mr Lepel Griffin's *Punjab Rájás*; Stewart's *History of Bengal*; Dr Hooker's *Himálayan Journals*; Vigne's *Travels in Kashmír*, and *Ghazni, Kabul, and Afghanistan*; Ferrier, *History of the Afghans*; Conolly's *Overland Journey to India*; Sir Alexander Burnes's *Cabool*; Dr Bellew's reports; Wheeler's *Madras in the Olden Time*, and his other valuable works; Malleson's *History of the French in India*; Hunter's *Annals of Rural Bengal, Orissa, and Indian Musalmáns.* (5) Among works bearing on British rule—*The Fifth Report on the Affairs of the East India Company*; selections from the *Calcutta Gazette* in the last century; Kaye's *Administration of the East India Company*; Keene's *Fall of the Mughal Empire*; Owen's *India on the Eve of the British Conquest*; Thorne's *War in India*, 1802–1806; Malcolm's *India*. 1811; Prinsep's *British India*, 1813–18; Kaye's *Sepoy War*, and continuation by Malleson; Fawcett's *Indian Finance.* (6) Short works on Indian history and geography, by Roper Lethbridge, Pope, Marshman, Wheeler, and Meadows Taylor. (7) Biographies of Clive, Warren Hastings, Sir Philip Francis, Lord Teignmouth, Malcolm, Minto, Metcalfe, Combermere. Sir Henry Lawrence, and Sir Herbert Edwardes; also the *Wellington Despatches* referring to India, by Sidney Owen; Lord Ellenborough's *Letters*; and Kaye's admirable Indian biographies. (8) In fiction and poetry, Edwin Arnold's *Light of Asia* stands first. Meadows Taylor's *Confessions of a Thug*, and *Tara*; *Pandurang Hari*; H. Cunningham's *Dustypore*; and *The Afghan Knife*, form well-known examples of the Anglo-Indian novel. (9) Indian official reports:—*Annual Administration Reports* of the various presidencies and provinces; *District Settlement Reports* in the North-Western Provinces, Oudh, and the Punjab; *General Reports of the Board of Revenue, Madras; Survey and Settlement Reports of Bombay; Census Reports* for the various presidencies and provinces in 1871–72, and their condensation, *The Memorandum on the Census of British India* (1871–72), presented to parliament in 1875; *Annual Reports on the Trade and Navigation of British India; Report of the Bengal Royal Commission*, 1880. (10) Parliamentary Blue Books:—*The Annual Statistical Abstract relating to British India*; *Annual East India Finance and Revenue Accounts*; *Statements on the Material and Moral Progress of India.* (W. W. H.)

INDEX.

INDIANA

[Compiled according to Census of 1880 and latest surveys.]



INDIANA

late II.

INDIANA, one of the Central States of the American Union, lies between 37° 47′ and 41° 50′ N. lat., and 84° 49′ and 88° 2′ W. long. It is bounded on the E. by the State of Ohio, from which it is separated by a line drawn due north from the mouth of the Great Miami river; on the S. by the Ohio river, separating it from Kentucky, between the mouths of the Great Miami and the Wabash; on the W. by Illinois, from which it is separated by the Wabash river from its mouth to a point where a line drawn due north from Vincennes last touches the western bank of that stream, thence north on that line to a point 10 miles north of the southern extreme of Lake Michigan; on the N. by a line drawn from that point due east until it intersects the eastern boundary, separating the State from Michigan. A small portion of Lake Michigan is included within the northern boundary. The coast-line is about 60 miles in length. Michigan City is the only lake harbour in the State. The extreme length of the State is 276 miles, with an average breadth of 145 miles; and the area is 33,809 square miles.

Topography.—Indiana occupies a broad table-land, for the most part level or gently undulating, except along the Ohio, where the plain has been deeply grooved by the affluent streams into hills and valleys. There are no elevations that could properly be termed mountains or mountain ranges. With the exception of a small portion which drains into the great lakes, the whole State inclines gently towards the south-west. The highest point (except a knob in Brown county) is found in the southern portion of Randolph county, and is 1253 feet above the sea; the lowest, at the mouth of the Wabash, is 370 feet. From careful surveys the mean altitude of the State is estimated at 735 feet above sea-level. It is well watered by numerous streams and rivers, but, with the exception of the Ohio and Wabash, few of them are navigable. The Wabash is the largest river that has its course mainly within the State; and, together with its branches, it drains three-fourths of the entire surface. It rises in the west of Ohio, and flows first in a north-west direction, and then south-west till it meets the boundary of Illinois, which it follows southward for more than 100 miles, till it falls into the Ohio, after a course of upwards of 500 miles. The Ohio forms the entire southern boundary of the State. The other principal rivers of Indiana are tributaries of the Wabash. The White River, the most important of these, is formed by the W. and E. Forks,—two rivers respectively about 300 and 200 miles long,—which unite about 100 miles above its confluence with the Wabash. The Maumee is formed by the St Joseph and St Mary in the north-east, and falls into Lake Erie. The Upper St Joseph, with its tributaries, passes through the northern counties, and falls into Lake Michigan. That portion south of the Wabash was originally covered with heavy forests of oak, beech, maple, walnut, ash, and other hard woods; north of that river was principally prairie, interspersed with small lakes.

Geology and Minerals.—Lower Silurian strata are well developed in the south-eastern part of the State, with a thickness of 800 feet. Next, to the west and north, in succession occur rocks of the Upper Silurian, with a thickness of 200 feet, and those of Devonian age, 180 feet thick. The last two formations spread over all the northern third of the State, deeply covered with glacial drift, and at points deeply eroded by ice and water flow of that age. The Coal-measures occupy over 7000 square miles in the western and south-western parts, furnishing seven workable seams, at a depth of 50 to 220 feet, and averaging 80 feet below the surface; the seams vary in thickness from 2½ to 11 feet, averaging 4½ feet; the quality is from fair to good; an area of 600 square miles in this field yields a superior "block" or splint coal. This, being free from sulphur and phosphorus, is used in blast furnaces as it comes from the mine, without coking, and is well adapted for the preparation of Bessemer steel. The Sub-Carboniferous or Mountain Limestone borders the Coal-measures on the south and east; it yields giant bands of choice limestone for building purposes, 30 to 50 feet thick, unlimited in extent, homogeneous, elastic to compensate for inequalities of temperature, and with endurance to bear the climatic changes. Near Leavenworth, in the southern part of the State, there is a remarkable calcareous cavern, the Wyandotte Cave. One of its chambers is 350 feet long and 245 in height. It abounds with stalactites and stalagmites of great variety and size.

Inexhaustible beds of fire clay, potter's clay, kaolin, and lime, as well as paving and building stone, are found in the southern parts of the State.

Agriculture is the chief branch of industry, the climate and soil being suited to the growth of cereals, fruits, and grasses. The following table, compiled from the report of the Bureau of Statistics, shows the production of the chief grain crops for 1880:—

	Acres.	Bushels.
Wheat	3,109,845	47,130,684
Indian corn	3,130,327	87,335,014
Oats	686,901	15,563,430
Rye	15,028	217,192
Barley	31,019	687,911

The meadow land amounted to 778,691 acres, and the hay produced was 1,221,164 tons. The same year the domestic animals numbered — horses 494,809, cattle 1,150,559, sheep 1,508,242, and hogs 4,253,586. There were 145,826 stands of bees, yielding 1,114,883 ℔ of honey.

Climate.—The climate is equable and healthy. In 1865 a United States signal station was established at Indianapolis, and the following meteorological tables have been compiled from the daily reports of this office. They indicate the temperature (in degrees Fahrenheit) and rainfall in inches during a period of fourteen years. The mean height of the barometer for the same period was 30·010 inches. The prevailing winds are from the south and west in summer, veering round to the north in winter.

Mean Monthly Temperature and Rainfall for Fourteen Years.

	January.	February.	March.	April.	May.	June.	July.	August.	September.	October.	November.	December.
Temperature	31·3°	36·7°	41·8°	54·1°	64·4°	74·3°	77·7°	75·6°	67·9°	54·7°	41·6°	33·5°
Rainfall (inches)	3·75	3·00	4·50	3·66	4·47	4·36	4·57	3·17	3·68	2·37	2·94	3·51

Annual Mean Temperature and Rainfall.

	1865.	1866.	1867.	1868.	1869.	1870.	1871.	1872.	1873.	1874.	1875.	1876.	1877.	1878.
Temperature	56·32°	56·46°	56·33°	55·56°	52·52°	55·25°	55·89°	52·75°	52·15°	55·04°	50·46°	53·20°	54·60°	55·40°
Rainfall (inches)	50·69	52·44	48·54	45·05	42·98	35·13	36·05	37·95	52·32	43·60	54·58	56·56	39·08	38·62

Manufactures, Communication, &c.—The manufacturing interests have increased rapidly during the last decade. The Bureau of Statistics reported the value of manufactured products for 1878 at $185,050,220, and the mercantile trade sales at $300,323,256. The increase of wealth is shown as follows by the appraisement for taxation :—

1850	$202,650,264
1860	411,042,424
1870	663,455,044
1880	767,387,172

On April 1, 1880, there were sixty-three railway corporations, working 4963 miles of railway in the State, traversing eighty-five counties, and appraised for taxation at $38,442,941. So completely does the railway system cover the State that one can go from the capital to almost any county and return the same day. The geographical position of the State is such that all the main railroad through-lines between the east and west have to cross Indiana.

Administration.—The State is divided into ninety-two counties, containing about 400 square miles each. The governor is elected for four years. The legislature, which meets biennally, consists of a senate of fifty, elected for four years, and a house of representatives of one hundred, elected for two years. The judges (five) of the supreme court are elected for six years. The State has thirteen representatives and two senators in Congress. All popular elections are by ballot. All elections by the legislature are *viva voce.* The State has no permanent debt. The constitution declares that no debts shall be incurred by the State except to meet casual deficits in the revenue, or to provide for the public defence, repel invasion, and suppress insurrection. On the organization of Indiana as a territory in 1800, Vincennes was made the capital ; when the State Government was formed in 1816, the capital was fixed temporarily at Corydon, until provision could be made for the permanent seat at Indianapolis, to which it was removed in 1824.

Education.—The foundation of the free school system was laid by Congress when, in admitting the State into the Union, the Government presented a section of land in each township to the inhabitants for free schools. A great advance was made in 1851, when in framing the new constitution it was provided that certain funds then belonging to the State, with all penal fines and forfeitures accruing, should constitute a common school fund, the principal to remain a perpetual fund, to be increased, but never diminished, and the annual income used for tuition only. This fund in 1880 amounted to $9,220,708, and is increasing. In the same year there were 9647 schoolhouses in the State, valued at $11,817,954. Of the children of school age (six to twenty-one) there were—males, white 354,761, coloured 7162; females, white 334,249, coloured 7386. Of these 511,283 attended the schools. The tuition revenue expended for the year ending June 30, 1880, was

Amount derived from State tax	$1,519,791·69
Interest on common school fund held by counties	204,145·30
State's interest on non-negotiable bonds	234,187·00
Amount derived from unclaimed fees	895·22
Congressional township revenue	198,247·66
Amount of local tuition tax	589,093·21
Proceeds of liquor licences	193,512·15
Total	$2,939,872·23

The State university is at Bloomington, and the State normal school at Terre Haute. The function of the latter is to fit its pupils to become teachers in the common schools. Perdue University, at Lafayette, is the State agricultural college. There are also a number of colleges, mainly under the control of religious societies, chief among which are Asbury University (Methodist) at Greencastle, Wabash College (Presbyterian) at Crawfordsville, Butler University (Christian) at Irvington (near Indianapolis), Notre Dame (Catholic) at South Bend, and Earlham College (Friend) at Richmond.

Population.—In point of population Indiana ranks as fifth State in the Union. The white inhabitants in 1765 are stated to have consisted of a few French families along the Wabash. The following table shows the population at decennial periods during this century :—

Year.	White.	Coloured.	Total.
1800	4,577	298	4,875
1810	23,890	630	24,520
1820	145,758	1,420	147,178
1830	339,399	3,632	343,031
1840	678,698	7,168	685,866
1850	977,154	11,262	988,416
1860	1,338,710	11,428	1,350,428
1870	1,655,837	24,560	1,680,637
1880			1,976,261

The return for 1880 shows a density of population of 57·8 persons per square mile.

The following are the chief towns, with population in 1880 :—Indianapolis, 75,074 ; Evansville, 29,280 ; Fort Wayne, 26,880 ; Terre Haute, 26,040 ; New Albany, 16,422 ; Lafayette, 14,860 ; South Bend, 13,279 : Richmond, 12,473 ; Logansport, 11,198 ; Jeffersonville, 10,422.

History.—Indiana originally constituted a part of New France. It was visited by the Jesuits as early as 1672. At the beginning of the 18th century the French opened a line of communication between the lakes and the Mississippi by way of the Maumee, Wabash, and Ohio rivers. Trading posts for barter with the natives were established at the head of the Maumee, where is now the city of Fort Wayne ; at Ouantenon, on the Wea Prairie, near the city of Lafayette ; and at Vincennes on the Wabash. Missionary stations were also established by the Jesuit fathers, in their endeavour to convert the Indians. At the close of the French war in 1763–4, the territory east of the Mississippi and north of the Ohio passed under British dominion. Pending the war between Great Britain and the American colonies, Colonel George Rogers Clark of Virginia, with an armed force, took possession of the territory, raising the American flag at Vincennes in 1778. By the treaty of 1783 between England and the United States this territory was recognized as belonging to the latter ; inasmuch as Virginia had fitted out Clark's expedition, she was entitled by the law of conquest to claim this vast dominion. During the colonial war Congress recommended the several States to cede their claims to unappropriated lands in the western country to the general government for the common benefit of the Union. Virginia, in pursuance of this request, yielded up her claims to the territory north-west of the Ohio. The deed of cession, executed on March 1, 1784, was signed by Thomas Jefferson, James Monroe, Arthur Lee, and Samuel Hardy. In 1787 Congress passed an ordinance for the government of the north-west territory, which provided, among other things, that not more than five States should ever be formed thereof, prohibiting slavery, and declaring that "religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall for ever be encouraged." This territory was subsequently divided into the States of Ohio, Indiana, Illinois, Michigan, and Wisconsin. Indiana was admitted into the Union as a State by Congress on April 19, 1816, being the sixth State received after the formation of the government by the thirteen original States and the adoption in 1787 of the present constitution. (A. C. H.)

INDIANAPOLIS, the capital of Indiana, is situated at almost the exact geographical centre of the State, in 39° 47′ N. lat., 86° 6′ W. long., 824 miles W. of New York by rail, and 194 miles S.E. of Chicago. It stands 721 feet above the sea-level, and 148 above Lake Erie.

On the admission of Indiana as a State into the Federal Union in 1816, Congress presented 4 square miles of public lands for its seat of government, to be selected by the State. The location was made in 1820 at the confluence of Fall Creek and White River. The site chosen was in the midst of the unbroken forest, 60 miles distant from the borders of civilization, and only reached by Indian trails. The name Indianapolis was given by an act of the Legislature on January 6, 1821 ; and Alexander Ralston was appointed to lay out the city. Selecting a slight mound near the middle of the ground as the centre of the proposed capital, Ralston laid out the town after the manner of Washington city, which he had helped to survey.

Four avenues radiate from the centre to the four corners of the city. The streets and avenues are 90 feet wide, except Washington, the main street, which is 120. The city has now outgrown its original limits, and extends 4 miles in length and 3 in width. It is built upon a level plain and surrounded by a fertile country. It was incorporated in 1836, and received a city charter in 1847. Its growth is shown by the following table:—

Year.	Population.	Assessed Value of Property.
1850	8,090	$2,326,185
1860	18,113	10,700,000
1870	48,244	25,981,267
1880	75,074	50,254,934

In 1847 the first railway entered the city. Within a few years thereafter other lines were constructed, until now twelve main lines converge in the Union Depôt. About one hundred passenger trains, connected with every part of the country, enter and depart daily. The numerous tracks being on a level with the surface of the streets, the obstruction and danger at the numerous crossings became very great on account of the increase of railway traffic, so that in 1877 a loop line, called the "Belt," had to be made passing round the city, to connect the various railroads. By means of it the "through freight cars" are conveyed past the city without blocking the traffic.

Indianapolis is in the centre of the swine-producing region, and pork packing is one of the chief industries of the city. The number packed in 1877 was 420,000 head; in 1878, 766,000; in 1879, 677,809. It is also largely engaged in the grain trade. The railways have been of greatest service to Indianapolis, compensating for its want of water transit. The manufacturing and mercantile interests, which are large and increasing, are the natural result of the city's extensive railroad connexions.

A system of graded free schools is maintained all the year. The city school property is valued at $1,041,000.

In 1871 a public library was established, and is supported by taxation, which now contains 36,461 volumes, and is rapidly increasing. The masonic temple, oddfellows' hall, post-office, U. S. arsenal, and chamber of commerce are handsome buildings. The Marion county court-house, standing on a public square in the heart of the city, was completed in 1877 at a cost of $1,411,524. The exterior is of Indiana limestone, the interior of iron and marble, with frescoed walls and ceilings. Its dimensions are 150 by 286 feet, and 240 feet to the top of the dome. The principal benevolent institutions of the State, viz., the institution for the education of the blind, that for the deaf and dumb, and the hospital for the insane, are located here; they are handsome and commodious buildings, the last having accommodation for 1313 patients. The State reformatory for women and girls, where all female offenders are imprisoned, adjoins the city. The institution is under the management of a board of control, composed of women chosen by the governor of the State. In 1877 the State began the erection of a new State house, to be completed in 1888, at a cost of $2,000,000. This will be one of the most imposing capital buildings in the United States.

By law the power to incur permanent debt is limited to a sum not exceeding 2 per cent. upon the assessed value of the property within the city; and the rate of taxation is limited to 90 cents per $100 for municipal purposes, 20 cents for public schools, and 2 cents for free libraries. (A. C. H.)

INDIAN ARCHIPELAGO. The East Indian Archipelago or Malay Archipelago, the largest island cluster in the world, lies to the south-east of Asia and to the north and north-west of Australia, and bears the impress in many of its most important characteristics, both natural and historical, of this twofold relation.[1]

Position and extent.

As the archipelago does not form a political unity, different writers assign it very different limits, according as they are influenced by one set of considerations or another. New Guinea to the east and the Philippines to the north are sometimes included and sometimes excluded; Sumatra is sometimes regarded as the most western member of the group, and sometimes that position is given to the Nicobar or the Andaman Islands. From the following survey of the extent of the archipelago the Malay Peninsula and New Guinea are excluded, but the Andaman Islands are admitted as having at least an ethnographical claim. The Balintong Strait, about the 20th parallel of N. lat., may be taken as the northern limit; and but for a small portion of the islands Timor and Sumba (Sandalwood Island), with their insignificant adjacencies, the southern limit might be stated as the 10th of S. lat. The Andaman Islands take us as far west as 93° E. long., the Aru Islands as far east as 135°. The equator passes through the middle of the archipelago; it successively cuts Sumatra, Borneo, Celebes, and Jilolo, four of the most important islands. To adopt Mr Wallace's graphic sentences (noting that he embraces New Guinea and the Solomon Islands), the archipelago "includes two islands larger than Great Britain; and in one of them, Borneo, the whole of the British Isles might be set down, and would be surrounded by a sea of forests. Sumatra is about equal in extent to Great Britain; Java, Luzon, and Celebes are each about the size of Ireland. Eighteen more islands are on the average as large as Jamaica; and more than a hundred are as large as the Isle of Wight."

The statistics of the area and population of the several islands can only be given approximately. The following table is based on statements contained in the sixth number of Behm and Wagner's *Die Bevölkerung der Erde* (Gotha, 1880):—

	Area.	Population.
	Sq. miles.	
I. Andaman and Nicobar Islands....	3,192	20,000
II. Sunda and Molucca Islands[2]... ...	655,720	27,343,000
(1) Borneo group............295,007 sq. m.	...	...
(2) Sumatra group..........179,458 ,,	...	...
(3) Java group............... 50,849 ,,	...	...
(4) Lesser Sunda group... 35,152 ,,	...	...
(5) South-Western group. 2,021 ,,	...	...
(6) Tenimber, Aru, and	...	...
Ke Islands............... 5,356 ,,	...	...
(7) Moluccas.................. 20,549 ,,	...	...
(8) Celebes group........... 77,250 ,,	...	...
III. Philippine Islands	114,096	7,450,000
Total	773,008	34,813,000

The total area is thus rather less than that of British India, and the population rather more than that of Great Britain and Ireland.

General appearance.

The islands of the archipelago nearly all present bold and picturesque profiles against the horizon, and at the

[1] For more detailed information respecting the several islands and groups of the archipelago the reader is referred to the separate articles BORNEO, JAVA, SUMATRA, PHILIPPINE ISLANDS, &c.

[2] Various subdivisions have been suggested of the great Sunda and Molucca groups, which may be described as the Indian Archipelago *par excellence*. Mr Wallace arranges them thus:—*The Indo-Malay Islands*—Borneo, Java, and Sumatra; *the Timor group*—Timor, Flores, Sumbawa, and Lombok; *Celebes*, with the Sulu Islands and Buton; *the Moluccan group*—Buru, Ceram, Batchian, Jilolo, and Morty, with the smaller islands of Ternate, Tidore, Makian, Kaióa, Amboyna, Banda, Goram, and Matabello. The Ke and the Aru Islands he treats along with New Guinea.

same time the character of the scenery varies from island to island and even from district to district. The mountains arrange themselves for the most part in lines running either from north-west to south-east or from west to east. In Sumatra and in the islands between Sumatra and Borneo the former direction is very distinctly marked, and the latter is equally noticeable in Java and the other southern islands. The mountains of Borneo rise rather in short ridges and clusters from the plain, like islands from the sea; the arrangement represented on even what are considered authoritative maps being, like much else in the cartography of the archipelago, the product of imagination. Nothing in the general physiognomy of the islands is more remarkable than the number and distribution of the volcanoes, active or extinct.[1] Running south-east through Sumatra, east through Java and the southern islands to Timor, curving north through the Moluccas, and again north from the end of Celebes through the whole line of the Philippines, they form as it were the rim of a great atoll (to use Dr Schneider's phraseology), rudely resembling a horseshoe narrowed towards the point. The loftiest mountain in the archipelago would appear to be the famous Kina Balu in Borneo; the loftiest of the volcanic peaks are Indrapura in Sumatra (12,255 feet), Semeru in Java (12,238), Gunong Agong in Bali (11,726), and Tamboro in Sumbawa (9324 feet).

An important fact in the physical geography of the archipelago is that Java, Bali, Sumatra, and Borneo, and the lesser islands between them and the Asiatic mainland, all rest on a great submerged bank, nowhere more than 100 fathoms below the surface of the sea, which may be considered a continuation of the continent; while to the east the depth of the sea has been found at various places to be from 1000 to 2500 fathoms. As the value of this fact has been particularly emphasized by Mr Wallace, the limit of the shallow water, which passes through between Bali and Lombok, and strikes north to the east of Borneo, has rightly received the name of Wallace's line. The Philippines, on the other hand, "are almost surrounded by deep sea, but are connected with Borneo by means of two narrow submarine banks."[2]

Geology. The geology of the archipelago has not been investigated even with the completeness attained in regard to the zoology and botany; but there is a very considerable collection of material in the publications of the mining engineers of the Dutch Government (*Jaarboek Mijnwezen Ned. O. Ind.*); and for the Philippines a valuable "Memoria geologico-minera" has been printed in the *Boletino* of the Commission of the Geological Map of Spain (Madrid, 1876). The results obtained by the Dutch engineers have been summarized by Dr Schneider, "Geologische Uebersicht über den holländ.-ostind. Archipel," in *Jahrbuch d. K.K. Geolog. Reichsanstalt*, Vienna, 1876, Bd. xxvi. There is a wide and varied representation of the azoic formations—gneiss, mica-schist, hornblende, &c., in Timor (which it may be remarked is geologically one of the best known of the islands), Ceram, Billiton, Banka, &c. Silurian rocks are found in Banka (where they contain the famous tin-mines), Billiton, and the Linga and Riouw archipelago; carboniferous limestone occurs in the north of Timor; the coal of Batchian is apparently similar to that of the English Carboniferous measures; and the Coal-measures of Borneo are thought by Van Dyk to be also Palæozoic. The Sumatran coal is of unascertained age. Permian rocks are present in Timor, Celebes, Pulo-Laut, and Sumatra. Of Secondary formations we find both Triassic and Jurassic rocks, the latter represented by Oolites in Timor, by a coralline limestone in Celebes. Cretaceous rocks occur in both these islands and in Celebes. Throughout the whole archipelago the Tertiary formations have a wide development both in their Eocene and their Miocene divisions. The latter is represented by foraminiferous limestone, and the former by nummulitic limestone. Lignite is freely distributed throughout the Tertiary strata of Java, Sumatra, and Nias. Among the rocks of economic importance may be mentioned granite of numerous kinds, syenite, serpentine, porphyry, marble (at least in southern Java), sandstones, and marls. Coal is worked successfully in Sumatra, Borneo, and Labuan. Diamonds are obtained in Borneo, garnets in Sumatra, Batchian, and Timor, and topazes in Batchian; antimony in Borneo and the Philippines; lead in Sumatra, Banka, Flores, and the Philippines; and copper and malachite in the Philippines, Timor, Borneo, and Sumatra. Iron is pretty frequent in various forms, and in some places might be successfully worked. Gold is not uncommon in the older ranges of Sumatra, Banka, Celebes, Batchian, Timor, and Borneo. Manganese could be readily worked in Timor, where it lies in the carboniferous limestone. Platinum is found in Landak and other parts of Borneo, and mercury in small quantities in Java.

Meteorology. The meteorology of the archipelago has hitherto been studied only in a very vague manner. For Batavia, indeed, there exists a mass of observations; and the observatory there is extending the region of its investigations. At the close of 1879 it had one hundred and twenty-five rainfall stations. A magnetic survey of the islands has been made by E. Van Rijckevorsel, whose report is published by the Academy of Sciences of Amsterdam. The most striking general fact is that, wherever that part of the south-east monsoon which has passed over Australia strikes, the climate is comparatively dry, and the vegetation is less luxuriant and luscious. The east end of Java, *e.g.*, has a less rainfall than the west; the distribution of the rain on the north coast is quite different from that on the south, and a similar difference is observed between the east and the west of Celebes. According to Dr Bergsma's *Rainfall of the East Indian Archipelago, First Year*, 1879 (which, like other publications of the Batavian meteorological office, is printed in English), at thirty-three stations out of fifty-nine the annual rainfall exceeded 100 inches, and at five stations 200 inches. The highest registration was 282 inches, at Padang Pandjang (Sumatra). The north-west monsoon, beginning in October and lasting till March, brings the principal rain season in the archipelago. The midday heat of the sun, it need hardly be said, makes itself powerfully felt. Exposure to its direct rays in Timor, for example, "at any time between 9 A.M. and 3 P.M.," says Mr Wallace (*Tropical Nature*), "would blister the skin in a few minutes almost as effectually as the application of scalding water," and Mr Moseley mentions that on wading into the sea at the Aru Islands he found the heat of the water actually greater than was at all pleasant. But at the same time the general climate cannot be said to be oppressive or unhealthy.

Vegetation. Most of the islands of the archipelago belong to that great forest-belt which, in the words of Mr Wallace, "girdles the earth at the equator, clothing hill, plain, and mountain with an evergreen mantle." In islands and districts where human civilization has been at work for centuries, the natural covering has in large measure given place to artificial tilth; and in Timor and several of the south-eastern islands the characteristics of New Guinea—luxuriant herbage and open park-like woodlands—are more or less strikingly predominant.[3] The

[1] A valuable list of these will be found in Junghuhn's *Java*, a work which contains many details in regard to various parts of the archipelago.

[2] Wallace, *Island Life*, 1880.

[3] Wallace, *Malay Archipelago*, p. 8.

field for botanical research in the archipelago is still vast and alluring. Among the very giants of the forest the unregistered species must be numerous; and, if we descend to the minor forms, it is a very poor collection that does not yield something absolutely new to science. The ferns, the pitcher plants, and the orchids are especially numerous, and have attracted particular attention. "The volcano of Pangerango in Java is said to have, for example, yielded three hundred species of ferns;" and Mr Burbidge, in a short excursion in Borneo in 1879, found upwards of fifty species that had not been previously obtained in the island.

For detailed information in regard to the flora, the reader may consult C. G. le Reinwardt, *Ueber den Character der Vegetation auf den Inseln des Ind. Archipels*, Berlin, 1828; Belanger, *Botanique du Voyage aux Indes Orientales*, 1825–1829, Paris, 1832; the various works of C. L. Blume (*Museum botanicum Lugd.-Bat.*, Leyden, 1849–51; *Collection des orchidées*, Amster., 1858, &c.); W. H. de Vriese, *Nouvelles Recherches sur la flore des possessions Neerland. aux Indes Or.*, Amst., 1845; Hasskarl, *Catalogus plantarum in horto botanico Bogoriensi cultarum*, Berl., 1844; F. Dozy and J. H. Molkenboer, *Bryologia Javanica seu descriptio muscorum frondosorum Arch. Ind.*, Leyden, 1844 58; H. Zollinger, *System. Verzeichniss der im Ind. Arch. 1842–1848 gesammelten . . . . Pflanzen*, Zurich, 1854; Miquel, *Flora van Nederlandsch Indië*, Amst., 1855, *Annales Musei Botanici Lugduno-Batavi*, 1869, and *Illustrations de la flore de l'Archipel Indien*, 1871 (continued by Suringar).

If we turn to the economical aspect of the vegetation, whether natural or cultivated, we cannot fail to be impressed by its varied resources. The list of fruits is a very extensive one; though unfortunately it is only with a very few of them that the untravelled European can have any practical acquaintance. Besides the orange, the mango, the mangosteen, the pomato or shaddock, the guava, the papaw, and the jack fruit, we have the rambutan, the tarippe or trap, the jintawan, the tampu, the bilimbing, the mamhangan, the langsat, the rambi, and the jambosa. The name at least of the durian is now well known (see Durian), and nearly as strange is the bawangutan (*Scordoprasum borneense*), of which the fruit, the leaves, and the branches have all a strong odour and flavour of onions.[1] Of what more distinctively deserve the name of food-plants the variety is equally notable. Not only are rice and maize (usually called *djagong* in the archipelago), sugar and coffee, among the widely cultivated crops, but the cocoa-nut, the bread fruit, the banana and plantain (usually called *pisang* in the archipelago), the sugar-palm (*Arenga saccharifera*), the tea-plant, the sago-palm, the cocoa-tree (which curiously yields the favourite beverage of the Sulu archipelago), the ground-nut, the *Caladium esculentum*, the yam, the cassava, and others besides, are of practical importance. The cultivation of sugar and coffee owes its development mainly to the Dutch; and to them also is due the introduction of tea. They have greatly encouraged the cultivation of the cocoa-nut among the natives, and it now flourishes, especially in the coast districts, in almost every island in their territory. The oil is very largely employed in native cookery. The sago-palm is most abundant in the island of Ceram, but is also found growing wild in Borneo, Celebes, Timor, and other islands of the Moluccas, in the Linga archipelago, and in parts of Sumatra. The product is mainly prepared for export. Pepper, nutmegs, and cloves were long the objects of the most important branch of Dutch commerce; and camphor, dammar, benzoin, and other products of a similar kind have a place among the exports. India-rubber and gutta percha are no longer obtained to the same extent as formerly.[2]

ogy.

To the naturalist the Indian archipelago is a region of the highest interest; and from an early period it has attracted the attention of explorers of the first rank. And yet the list of its living forms is far from being completely ascertained. The best known district is western Java, and Timor, the Moluccas, and the Papuan Islands have for the most part been well explored. Only parts of Sumatra, Borneo, and Celebes have been worked, and most of the other islands have yet to be dealt with.[3] Zoologically the archipelago belongs to two distinct regions—the eastern or Papuan, and the western or Malay or Indian. This latter region, according to August von Pelzeln ("Ueber die Malayische Säugethiere-Fauna" in *Festschrift zur Feier des Fünfundzwanzigjährigen Bestehens der K.K. Zool.-Bot. Gesellschaft in Wien*, Vienna, 1876), comprises southern China, Tibet, the Himalaya, and Further India, as well as the islands of the archipelago up to Wallace's line. He finds six genera of the *Quadrumana*, fourteen of the *Chiroptera*, five of the *Insectivora*, fourteen of the *Carnivora*, six of the *Rodentia*, of the *Edentata* one only (*Manis*), five of Ruminants, and three of Pachyderms. Sumatra indicates a connexion with the Malacca peninsula by *Nemorhœdus*, the elephant, *Gymnura*, and the tapir. *Pithecus*, *Tarsius*, and *Ptilocercus* seem peculiar to the Sunda Islands. The Philippines have *Semnopithecus*, *Macacus*, *Cynopithecus*, *Galeopithecus*, *Pteropus*, *Taphozous*, *Vespertilis*, *Viverra*, *Paradoxurus*, *Pteromys*, *Mus*, *Rusa*, and *Cervulus*.

In his various works Mr Wallace has made the English reader familiar with the most striking features of zoological distribution in the archipelago; and in his *Island Life*, especially, the ornithology receives particular attention. For details in regard to the mammals and birds, see Horsfield, *Zoological Researches in Java and the Neighbouring Islands*, 1834; Van Temminck, *Monographies de Mammologie*, 1827–1829 and 1835–1841; *Verhandelingen over de natuurlijke geschiedenis der Nederlandsche overzeesche bezittingen*, containing papers by S. Muller and H. Schlegel; zoological appendix to Belcher's *Voyage of H. M. Ship "Samarang,"* Lond., 1850; H. Schlegel, *Muséum d'hist. naturelle des Pays-Bas.: Revue méth. et crit. des Collections*, Leyden, 1863–76; Id., *Mém. sur les quadrumanes et les cheiroptères de l'archipel indien*, Amst., 1864; Id., *De Vogels van Nederlandsch Indië beschreven en afgebeeld*, Leyden, 1876; Von Rosenberg, "Overzichtstabellen voor de Ornithologie van den Indischen Archipel" in *Acta Scient. Ind. Neerland.*, part v.; T. Salvadori, "Catalogo sistematico degli uccelli di Borneo," in *Annali di Genova*. To the herpetology of the archipelago valuable contributions have been made by P. Bleeker, A. C. J. Edeling, and A. B. Meyer. Like so much else of value, their papers are mainly to be found in the *Nat. Tijds. van Ned. Ind.* For the fishes the great modern authority is Bleeker, whose principal work, however, was left unfinished (*Atlas ichthyologique des Indes orientales Neerlandaises*), and whose smaller contributions are scattered through more than a dozen periodicals.

Ethnology.

The ethnology of the Indian archipelago does not lack its difficult problems; but some outstanding features are easily described. There are at least two main native races, the brown long-haired Malay and the darker-skinned frizzly-haired Papuan. And to these more recent explorations make it almost certain that a third and probably more thoroughly aboriginal race—the Negrito—must be added, though even specialists who have had opportunities of direct observation are not unanimous in regard to this noteworthy element. The Malays are subdivided into an immense number of tribes and peoples in the most various stages of civilization, and broadly differenced from each other by physical and linguistic characteristics. Of chief note are the Malays proper, the Javanese, the Bugis, the Tagalas, and Bisayas, the people of the Moluccas, the Dayaks (mainly in Borneo), the Battaks of Sumatra, the Sulu islanders (closely similar to the tribes of northern Borneo). The Papuan race is chiefly to be found in the eastern section of the archipelago. Besides these three races, whose first connexion with the archipelago dates from before the dawn of history, we have a variety of intrusive elements, traceable by more or less strictly historical

[1] See Burbidge's interesting chapter in his *Gardens of the Sun*, 1880.

[2] Compare Musschenbroek, *Mededeelingen omtrent grondstoffen uit het oost. gedeelte van onzen Ind. Archipel*, Briel, 1880.

documents. A Hindu strain is evident in Java and others of the western islands; Moors and Arabs (that is, as the names are used in the archipelago, Mahometans from various countries between Arabia and India) are found more or less amalgamated with many of the Malay peoples; and the Chinese form, in an economical point of view, one of the most important sections of the community in many of the more civilized districts. Chinese have been established in the archipelago from a very early date: the first Dutch invaders found them settled at Jacatra; and many of them, as, for instance, the colony of Ternate, have taken so kindly to their new home that they have acquired Malay to the disuse of their native tongue. Chinese tombs are among the objects that strike the traveller's attention at Amboyna and other ancient settlements.

For the ethnology of the archipelago, see Meinicke, "Ueber die Völkerstämme des Ind. Archipelagus," in *Annalen der Erdkunde*, 1837; Spencer St John, "The Population of the Ind. Arch.," in *Journal of the Ind. Archipelago*, 1849; G. W. Earl, *The Native Races of the Ind. Arch.: Papuans*, Lond., 1853; Logan, "On the Ethnology of the Ind. Arch.," in *Jour. of Ind. Arch.*, 1847, 1850, 1851, 1853, 1854; and the rich collections in the *Tijdschrift v. Ind. T. L. en V. Kunde.* An excellent summary of the subject by A. H. Keane will be found as an appendix to Wallace's *Australasia* (Stanford's *Compendium of Geography and Travel*), Lond., 1879. See also the same writer's papers in *Nature*, 1881.

Languages.

There is a vast field for philological explorations in the archipelago. Of the very great number of distinct languages known to exist, few have been studied scientifically. The most widely distributed is the Malay, which has not only been diffused by the Malays themselves throughout the coast regions of the various islands, but, owing partly to the readiness with which it can be learned, has become the common medium between the Europeans and the natives. The most cultivated of the native tongues is the Javanese, and it is spoken by a greater number of people than any of the others. To it Sundanese stands in the relation that Low German holds to High German, and the Madurese in the relation of a strongly individualized dialect. Among the other languages which have been reduced to writing and grammatically analysed are the Balinese, closely connected with the Javanese, the Battak (with its dialect the Toba), the Dayak, and the Macassarese (see the writings of R. van Eck, H. N. van der Tuuk, A. Hardeland, and B. F. Matthes). Alfurese, a vague term meaning in the mouths of the natives little else than pagan, is more particularly applied by the Dutch philologists to the native speech of certain tribes in Celebes. The commercial activity of the Buginese causes their language to be pretty widely spoken,—little, however, by Europeans.

A general sketch of the languages of the archipelago will be found in *De Gids*, 1864, from the pen of Professor Veth. See also Robert Cust, *Sketch of the Modern Languages of the East Indies*, 1878. A bibliography of this department will be found in Boele van Neusbroek, *De beoefening der oostersche talen in Nederland en zijne overzeesche bezittingen* 1800–74 (Leyden, 1875).

Population.

The statistics of the population are, with the exception of those for a few limited areas, such as Java, of the most unsatisfactory character The estimate of Behm and Wagner in 1880 has been already stated,—34,813,000. This gives the comparatively sparse proportion of 45 to the square mile. The distribution, too, is extremely unequal. In Java we have as much as 364 to the square mile, and in the Philippines about 65, so that for the remaining islands the average is only about 15. It would appear that when left in their natural savage or semi-savage condition the natives increase very slowly in numbers, and in some cases hardly maintain their ground.

Political divisions.

Politically the Indian archipelago is subject to a sixfold division:—the independent native states and tribal territories, the Spanish possessions, the Portuguese possessions, the Dutch possessions, the English possessions, and the state of Sarawak. The Dutch are by far the most influential power in the archipelago. The Spanish authority is confined to the Philippines and the Sulu archipelago,—the latter rendered tributary to them by the native sultan in August 1878 in return for an annual subsidy of 2400 dollars. The English, if the island of Singapore be considered as belonging rather to the Malacca Peninsula, possess only the island of Labuan (19,350 acres), acquired in 1847,—though the establishment of the British Bornean Company in the north of the island may prove the beginning of a new acquisition. To the Portuguese are subject part of Timor and the island of Kambing, in all 6192 square miles. The Dutch on the other hand claim, besides an area of 149,820 square miles in western New Guinea, a total territory in the archipelago of 566,383 square miles, or forty-four times as much as the governing country. Of the really independent native states the largest is that belonging to the sultan of Brunei (Borneo); it is estimated to have an area of about 88,000 square miles

The Dutch territ[ory].

The Dutch divide their territory into two great divisions—(1) Java and Madura, and (2) the Outer Possessions. The former, which comprises also Bali and Lombok, is administratively divided into twenty-three residencies, which are subdivided into departments or assistant residencies. The Outer Possessions are organized in a similar manner, but several portions of them—the West Coast of Sumatra, Celebes and its dependencies, and Achin or Atjh—constitute governments with residencies under them. Of the other residencies the principal are those of the East and South-East coasts of Sumatra, Riouw and its dependencies, the island of Banka, Western Borneo, Southern and Eastern Borneo, Menado in the north of Celebes, Timor, Amboyna, and Ternate, the last being nominally the most extensive of all, from including an unusually large proportion of native territory.

The accusation frequently made against the Dutch that they furnished little information about their East Indian possessions has long ceased to have any foundation in fact. The Government publish at Batavia a large annual *Regerings Almanak voor Nederlandsch Indië* (that of 1880 contains upwards of 1200 pages); and every year there is presented to the Dutch parliament a voluminous *Koloniaal Verslag*, containing elaborate details on all departments of the administration. The *Tijdschrift voor Nederlandsch Indië* of Dr W. R. Baron van Hoëvell, continued by a society of statesmen and scholars (Zaltbommel), the *Bijdragen tot de Taal- Land- en Volkenkunde van Nederlandsch Indie* of the Royal Institute at the Hague, the *Indische Gids* (Amsterdam), and the *Indische Mercuur* (Haarlem), a monthly organ of trade, show the interest taken in Holland in the East Indian possessions. Of the numerous periodicals published at Batavia it is enough to mention the *Statistiek van den Handel*, the *Verslag van's lands plantentuin te Buitenzorg*, the *Tijdschrift van het Kon. Instituut voor Ingenieurs*; the *Verhandlingen* of the Batavian Society of Arts and Sciences, and the same society's *Tijdschrift voor Ind. Taal- Land- en Volkenkunde*; the *Ind. Militair Tijdschrift*, the *Natuurkundig Tijdsch.*, the *Geneeskundig Tijdsch.*, and *Tijdsch. voor Nijverheid en Landbouw.* Another Tijdschrift of the Ind. Agricult. Soc. is published at Samarang.

The population subject to the Dutch is partially indicated in the following table:—

	1877	Males in 1877.	1878
Java and Madura.			
European	28,672	15,586	29,998
Chinese	198,233	103,269	200,303
Arabs	9,379	5,115	8,839
Other Eastern foreigners ...	3,961	2,077	4,115
Natives	18,567,075	8,987,999	18,824,574
	18,807,320	9,114,046	19,067,829
Outer Possessions.[1]			
Europeans	7,688	3,988	8,028
Chinese	126,710	96,448	119,534
Arabs	4,634	2,299	4,708
Other Eastern foreigners ...	7,405	5,681	9,150

How rapidly the Chinese element is increasing is shown by the fact that in the five years 1874–78 permission to reside within Dutch territory was granted to 13,302 Chinese; while similar per-

[1] No accurate data are known for the native tribes of the Outer Possessions.

mission was obtained by only 749 "Europeans"[1] (including Armenians and Persians) and 1421 Arabs. Slavery was abolished in the strictly Dutch portions of the Indies on the 1st of January 1860, and under Dutch influence it is being abandoned by the native states.

Government. The functions of the governor-general of the Dutch possessions may briefly be described as those of a viceroy. He has command over the land and sea forces, and supreme supervision of all parts of the general administration. His also is the right of declaring war and peace, and of concluding treaties with the native princes and peoples. No sentence of death can be executed in time of peace without his authority, and he enjoys the right of mercy and amnesty within certain definite limits.

The governor-general is assisted by a council (*Raad van Nederlandsch Indie*), consisting of a vice-president and four members (all named by the king), assisted by a secretary. In relation to the executive the council is an advising body; but in the exercise of the legislative functions, and in certain definite cases, if the governor-general disagrees with his council, he must appeal to the king for direction. The council has its seat at Batavia, and meets every Friday.

The governor-general has besides a cabinet called the "general secretariat," the head of which is the general secretary (assisted by two Government secretaries), who acts as referee and adviser of the administration. Besides his strictly secretarial duties he compiles the *Staatsblad van Nederlandsch Indië* and the *Regerings Almanak voor Nederlandsch Indië* (published since 1816). A general chamber of accounts for the Dutch East Indies, consisting of a president and six members, has its seat in Batavia.

The administrative departments have undergone considerable changes from time to time. At present there are five directors—(1) of inland administration, (2) of education, religion, and industry, (3) of public civil works, (4) of finances, and (5) of justice, the last added in 1869. To the department of justice belong, not only the supervision of the courts and law business, but that of the *weeskamers* and *boedelkamers* or chambers of wardship and legacies, the granting of right of residence, the control of the press, and the right of public meeting. The supreme court has its seat at Batavia, and there is an elaborate and intricate system of subordinate courts of justice, European and native. It is only the chief officials that are Europeans, in accordance with the dominant policy in the whole constitution of the departments of inland administration and justice, that the relations of native with native should be left as much as possible in the hands of native courts. In all about two hundred native princes are tributary to the Dutch authorities.

Finance. To the department of finance belong (1) the taxes and resources of the colony, farmed or unfarmed, so far as they do not depend on some other department; (2) the control of public auctions; (3) the mint; and (4) various duties connected with the colonial budget and the colonial treasury. The custom of farming a large part of the revenue has long been in vogue, and despite the theoretical objections to the system, it has one great advantage, it pays. The sale of opium is one of the principal Government "farms." The cultivation of the poppy is absolutely forbidden in the archipelago, and the demand is satisfied by imports from British India and the Levant. From the Government supply so obtained the contractor is obliged to take a certain definite quantity at a high fixed price; beyond this he may purchase at ordinary cost price what he finds requisite. The total gain from this monopoly was £1,259,212 in 1879, though the local authorities are instructed to do all in their power to prevent the spread of opium-eating. The whole of what are called "the lesser resources" of the Government, consisting of a curious miscellany of taxes, do not yield a third of the opium revenue. Of the branches of the revenue not farmed, the chief are the customs or import and export duties. The average these yielded for the five years 1874-78 was £720,378. Two important taxes, known as the personal tax and the income tax, both levied on Europeans, were introduced in 1879.

The most striking feature in the administration of the Dutch East Indies is undoubtedly this that, instead of being a drain on the resources of Holland, the colony pays annually a most important contribution into the national exchequer. When these possessions were taken over by the mother country they were burdened with a large debt, and the financial state of the colony remained very unsatisfactory for many years; but on the introduction of the culture system in 1830 the aspect of affairs was speedily changed, and in the fourteen years from 1865 to 1878 there was a clear gain of about £18,000,000 from the colonial administration.

Army and navy. On December 31, 1878, the strength of the military forces in the East Indies was 38,106 men, of whom nearly one half were Europeans. This, however, does not include the militia corps, which were established in certain places. At the same date the East Indian navy comprised 27 ships and 154 cannon. The strength of the military marine was 2934 Europeans and 969 natives, while the vessels were manned by 2630 Europeans and 1012 natives.

There is an elaborate department of education, public worship, and industry; but it is astonishing how little has hitherto been accomplished in the European instruction and Christianizing of the natives.

Education. The educational organization consists of two departments—a European and a native; but it is only within recent years that the latter has begun to attract the active interest of the Government. For secondary European education the great institution is the Gymnasium Willem III. at Batavia. In 1878 there were 68 Government primary schools for Europeans in Java and Madura, and 28 in the Outer Possessions, with a total attendance of 7223 children. With the exception of certain medical colleges, all the institutions in the native department are for primary instruction. At the end of 1878 these schools numbered 376; 214 of them were in the Outer Possessions. In Java and Madura there is a grand total of 28,000 native children receiving vernacular education, and if the Outer Possessions are included the number must be more than doubled. There are nine training schools for native teachers, most of them established since 1870; and in 1879 four schools were opened for sons of the native princes and aristocracy.

Religion. The Protestant churches of the Dutch Indies compose a church union, administered very much according to Presbyterian usage. The number of preachers and assistant preachers is limited by Government, the former to 35 and the latter to 21, by a royal decree of 1863. The Roman Catholics are under a vicar-apostolic, who is also bishop of Batavia, and 20 of their ecclesiastics are paid by the state. Christianity has not as yet made much progress among the natives, the returns for 1878 showing only 174,462 native Christians, of whom 225 were Chinese. In Java and Madura the Christians do not number so much as 1 in 2300 of the population. Mahometanism is the religion of a large proportion of the natives, and is at present making more advances in relation to the heathen population than Christianity. The Dutch Government grants passes for about a shilling each to those who wish to make the pilgrimage to Mecca; and the numbers who set out in 1877, 1878, and 1879 respectively were 6893, 5632, and 5438, besides about 1500 from the native states.

Public works. The administration of the department of public works shows that the Dutch have not belied their European reputation for civil engineering and industrial activity in their Indian colony. The roads and bridges, canals and irrigation works, which they have executed in their central island win the admiration of foreign visitants. Java is the only island which has even the beginning of a railway system, but considerable progress has been made there; and the postal and telegraph services are being rapidly developed.

Imports. The total imports of private trade (including specie) amounted in 1876 to 116,392,762 florins (1 florin = 1s. 8d.), and in 1877 to 126,066,462; and at the same time 5,118,938 florins and 27,637,954 florins respectively were imported in name of the Government. Of the 109,177,424 florins of general imports (excluding specie) in 1876, 47,694,270 florins were from Holland, 33,042,854 from other countries outside of the archipelago, and no less than 27,632,294 from Singapore alone; and of the Government imports 2,207,611 florins were from Holland and 2,033,910 from Singapore. In 1877 cotton manufactures figure among the general imports for 43,566,127 florins, and yarns for 3,325,323; rice for 7,798,348; petroleum, 5,430,103; cigars, 2,892,369; tea, 2,405,511; coals, 2,268,520; and iron and iron goods 2,362,525. The opium is the most extensive of the Government imports.

Exports. The general exports (specie excluded) were 154,229,384 florins for 1876 and 161,863,449 for 1877; those of the Government, 51,168,108 and 57,116,672. In 1876 the more important articles showed as follows:—coffee (private trade) 34,347,870 florins, (Government) 54,208,868 florins; sugar, 62,583,164 florins; tobacco for the European market, 27,794,755 florins; gambir, 2,036,592; gutta percha, 1,651,292; benzoin, 582,581; dammar, 1,025,737; india-rubber, 83,171; gum copal, 128,075; indigo for the European market, 3,686,942; nutmegs, 2,815,787; cocoa-nut oil, 1,220,682; pepper, 1,883,349; rice, 2,292,907 florins.

History. The Portuguese were the first Europeans to visit the Indian archipelago. Prior to their appearance off Sumatra in 1509 under Diogo Lopez la Sequiera, a Hindu civilization, having its chief seat in Java, had flourished and waned, and Mahometanism had succeeded to a considerable share of its inheritance. In 1521, when the Portuguese name had become familiar in the islands, the Spaniards under Magellan made their appearance from the east. Hostilities ensued, which continued till the treaty of 1529, by which the boundary between Spaniards and Portuguese was fixed at 17° E. of the Moluccas,—a line which afterwards proved matter of dispute. The two powers were undisturbed except by an unimportant French expedition till 1596, when the Dutch reached what was destined to be the scene of their greatest colonial achievements. In that year Cornelis Houtman appeared before Bantam, the chief town of a powerful kingdom in Java, and his expedition was but the precursor of many others from Holland. The commercial success of these enterprises led in 1602 to the establishment of the Dutch East Indian Company, which obtained by Government

[1] The technical use of this name extends it to all except Arabs, Moors, Chinese, and generally all Mahometans and pagans, who are collectively classed as natives.

charter the monopoly of the Dutch trade of the countries between the Straits of Magellan and the Cape of Good Hope, with the right of concluding treaties, appointing governors, &c. The first fleet sent out by the new Company under Van der Hagen was instrumental in capturing the Portuguese fort of Amboyna, and the peace of Treves in 1609 set the Dutch free from interference on the part of the Spaniards. In the same year the states-general appointed a governor-general of the East Indies, giving the Company the right of appointing his successor, subject to their approval.

The instructions given to Pieter Both, the first governor, struck the key-note of that policy which has brought so much obloquy on the Dutch name, and prevented the better features of their colonial administration from being appreciated. He was to "give all endeavour in order that the commerce of the Moluccas, Amboyna, and Banda should belong to the Company, and that no other nation in the world should have the least part." When he came into power there were already Dutch forts at Jilolo, Ternate, and Batchian, and the people of Banda had granted the Dutch the monopoly of nutmegs. It was to the fourth governor (J. P. Coen, 1619–23 and 1627–29) that the Company were most indebted for their territorial aggrandizement. He was the founder of Batavia (1620), and the first to introduce a regular system of accounts in the affairs of the Company. During his rule a treaty was concluded between the English and Dutch companies, but unfortunately the goodwill which might have resulted from it was not of long duration. Specx (1629–32) gave a start to the trade with Japan, which afterwards grew to vast and various issues. The governorship of Van Diemen (1636–45) was signalized by a series of successes over the Portuguese, and the introduction of the first code of laws. The Dutch power in the archipelago extended rapidly during the latter part of the century. Peace was made with the Portuguese (1661), and various native kingdoms acquired. In the beginning of the 18th century the expense of the necessary military operations and general administration, with other causes, brought the colony into financial difficulties, and in the latter part of the century it was greatly damaged by the rapidly growing predominance of the English in India and Ceylon. The loss of their possessions in India, however, caused the Dutch to give more attention to the archipelago, and they continued to increase their territory. At the same time the state of the finances grew worse and worse, leading to the complete abolition of the Company's authority in 1800, when their possessions and liabilities were both appropriated by the nation. During the term of office of H. W. Daendels (1808–11), the English, who some years before had threatened Batavia and captured Ternate, made themselves masters of the Moluccas, and his successor Janssens was obliged in 1811 to surrender the colony and its capital to Lord Minto.[1] The British occupation lasted for five years, and during most of this time the post of governor-general was held by Sir Stamford Raffles, who acted perhaps too much on the supposition that the English occupation would be permanent, and was undoubtedly biased by strong prejudice against the Dutch, but at the same time did not forget Lord Minto's advice "to do as much good as he could." To the Dutch themselves this temporary government by the English did ultimate service. The example set by Raffles, when he showed so keen an interest in all that related to the country and the people, proved a stimulus to his Dutch successors; and the whole relation of the Government to scholarship and investigation has been placed on a more liberal and European footing. The restoration of the East Indian possessions to the Dutch was decided by the treaty of 1814, but was not carried out till 1816, when Baron van der Capellan became governor-general.[2] A variety of local disturbances followed the change of government, and a more serious war in Java (1825–30) required a special expedition from Holland. The year 1830 saw the beginning of that famous "culture" system, under Van den Bosch, to which so much of the financial success and peaceful administration of the modern Dutch government must be ascribed. In 1846 a new code of laws was introduced. The recent history of the colony may be briefly described as a gradual but steady extension of the authority of the Dutch Government, marked by a succession of revolts, disturbances, expeditions, skirmishes, and subjugations; a gradual but steady endeavour to develop the resources of the country; and, it may happily be added, an endeavour growing ever stronger and more enlightened to improve the condition of the subject races.

[1] See *Life of Lord Minto*.

[2] The following is a list of the Dutch governors from that date:—Godert A. G. P. Baron van der Capellan (19th August 1816 to 1st January 1826); Hendrik Merens de Kock (lieut.-gov.-gen., 1826 to 16th January 1830); Count Johannes van den Bosch (1830 to 2d July 1833); Jean Chrétien Baud (1833 to 29th February 1836); Dominique Jacques de Eierens (1836 to 1840, died 30th May); Carel S. W. Count van Hogendorp (1st June 1840 to 6th January 1841); Pieter Merkus (1841 to 15th February 1843, gov.-gen. till 1844, died 2d August); Joan Cornelis Reijnst (5th August 1844 to 30th September 1845); Jan Jacob Rochussen (1845 to 12th May 1851); George Isaac Bruce (died before his departure); Albertus Jacob Duijmaer van Twist (12th May 1851 to 22d May 1856); Charles F. Pahud (1856 to 2d September 1861); Arij Prins (2d September 1861); Ludolf Anne Jan Wilt, Baron Sloet van de Beele (19th October 1860 to 25th October 1866); Arij Prins (2d October 1866); Pieter Mijer (28th December 1866); James London (1st January 1872 to 26th March 1875); J. W. van Lursberge (26th March 1875).

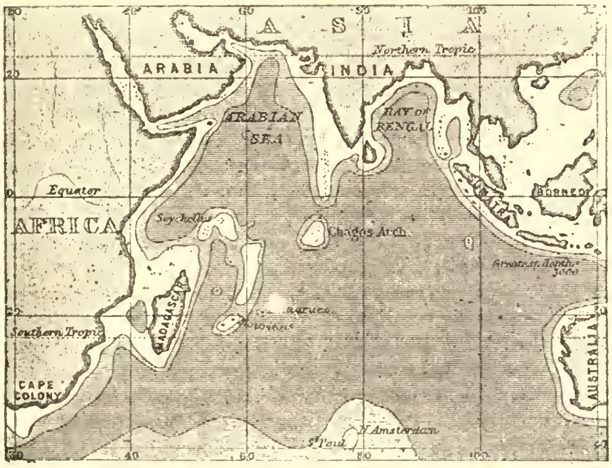
The literature connected with the East Indian archipelago is a vast and rapidly increasing one. For general information we have—J. Crawfurd, *History of the Indian Archipelago*, Edin., 1820, 3 vols.; J. H. Moor, *Notices of the Indian Archipelago*, Singapore, 1837; P. P. Roorda van Eysinga, *Handboek der Land- en Volkenkunde van Nederl. Indië*, 1841; A. J. van der Aa, *Nederlandsch Oost-Indië*, Amsterdam, 1845–57, 4 vols.; and the *Aardrijkskundig en statistisch Woordenboek van Nederlandsch Indië*, Amsterdam, 1869, to which Professor Veth, Jonkheer van Alphen, and other specialists were important contributors. Of works which contain the results of recent individual explorations, the most important are—Wallace, *The Malay Archipelago*, 3d ed., London, 1873; Rosenberg, *Die Indische Archipel*, Leipsic, 1878; Backer, *L'archipel indien*, Paris, 1874. Early notices of the archipelago are found in several Arabic writers. The first European to give any details is the Italian traveller Lodovico di Varthema, but little confidence can be placed in his narrative. Navarrete's *Coleccion de documentos*; Castanheda's *Historia de descobrimento*, Lisbon, 1833; Gaspar Correa's *Lendas* or *Legenda*; De Barros, *Asia*; Faria y Sousa, *Asia Portuguesa*, Lisbon, 1666; and A. de Morga, *The Philippine Islands, Moluccas, &c., at the close of the 16th century*, translated from the Spanish, Hakluyt Society, 1868, may be consulted for the early history; a critical *resumé* of which, from the pen of P. A. Tiele, is to be found in *Bijdragen tot de Taal- Land- en Volkenkunde van N. I.*, The Hague, 1878. *Facile princeps* among older Dutch works is Valentijn's voluminous and well-known *Oud en Nieuw Oost Indie*, Amsterdam, 1724–26. Dealing more restrictedly with the Dutch colony are G. Lant's *Geschiedenis van de vestiging, &c., in Indie*, Gron., 1852–60; Saalfeld, *Geschichte des Holländ. Colonialwesens in O. Ind.*, Gött., 1812; Gerlach, *Fastes militaires des In. Or.*, Zaltbommel, 1859; Du Bois, *Vies des gouverneurs-généraux*, Hague, 1763, with some good plans and views; Elout, *Bijdragen tot de Kennis van het Koloniaal beheer*, 1851, and other volumes of *Bijdragen* from his papers, published in 1863 and 1874; P. Myer, *Verzameling van instructien, ordonnancien, &c., voor de regering v. Ned. Ind.*, Bat., 1848; Boudewijnse and Van Goest, *De Indo-Nederlandsche Wetgeving*, 1816–57, Haarlem and Batavia, 1876–79; E. de Waal, *Nederlandsch Indië en de Staten-Generaal sed. de grondwet v.* 1814, Hague, 1860–61. A bibliography of the Dutch Indies was compiled by J. A. van der Chijs, *Proeve eener Nederlandsch Indische bibliografie*, 1659–1870, Batavia, 1875. (H. A. W.)

INDIAN CORN. See MAIZE.

INDIAN OCEAN. This designation is given to the portion of the oceanic area which extends northwards from the great southern water-zone, between the eastern coast of South Africa and the western boundary of the partially submerged Malayo-Australian continent. But whilst the Atlantic and Pacific extensions from the southern water-zone—the one dividing South Africa from South America, and the other forming the wide expanse of ocean between the western coast of South America and the eastern side of the Malayo-Australian continent—are prolonged into the land hemisphere as far as the north polar area, the Indian Ocean does not extend itself northwards beyond the Tropic of Cancer, where it is abruptly closed in by the great land mass of the Asiatic continent. The north-western boundary of its basin is formed by the south-eastern coast of Arabia, its north-eastern by the western coast of Burmah. But, between these two parts of its border, its basin is encroached on by the southward projection of the Indian peninsula, and is thus divided into two deep gulfs, of which the western is distinguished as the Arabian Sea, and the eastern as the Bay of Bengal. Now, looking to the fact that these gulfs must have been united, at no remote period, by a transverse band of sea, covering what is now the continuous alluvial plain of Northern India, we may consider the real northern border of this basin to be the great Himalaya range, the southern slope of which must have once formed its shore-line. It is remarkable that nearly the whole of its land-border is of considerable elevation,—being formed on the west by the mountainous ridge that flanks the great table-land of South Africa, on the north-west by the corresponding ridge which forms the south-eastern border of the elevated plateau of Arabia, whilst near its eastern margin there is a nearly continuous mountain range, that extends southwards from Assam to the extremity of the Malay Peninsula, and is thence prolonged through Sumatra and Java.

The Indian Ocean has no definite southern limit, but is considered to terminate at the parallel (about 38° S.) which stretches between the southernmost points of the African and Australian continents,—near which, about midway between these two extremes, lie the volcanic islands of St Paul and Amsterdam. And this seems the natural border of its basin, the sea-bed (as will presently appear) showing a distinct rise to the south of this parallel along a considerable part of it. The Indian Ocean is often spoken of as divided by the equator into a northern and a southern portion; and this division it will be convenient to adopt in the description of its current-system.

Depth and Islands.—The main basin of the Indian Ocean has an average depth of about 2500 fathoms, increasing to 3000 fathoms in the angle between Java and north-western Australia, which is the deepest part of it yet sounded. Its southern border is formed by a submarine plateau, which rises in some parts to within 1500 fathoms of the surface, and which forms the common foundation, not only of the islands already mentioned, but also of the Crozets, the Kerguelen group, Prince Edward's Islands, and the Heard Islands, all of which seem to have had a volcanic origin. This plateau, however, does not shut in the south-eastern portion of the basin; for a southward extension of the depression already described follows the trend of the western and southern coasts of Australia and the western coast of Tasmania, and is continuous with the deep channel (in some parts exceeding 2500 fathoms) between Australia and New Zealand. The western and north-western parts of the basin, on the other hand—as the number of their island-groups would lead us to anticipate—have a much less uniform depth. In the first place, the western border of the basin is encroached on by the great island of Madagascar, which must be considered as an outlying extension of the continental platform of South Africa, the Mozambique channel being comparatively shallow; and, although the bottom, at



Plan showing Depths of the Indian Ocean.
To 1000 fathoms, white; 1000 to 2000 fathoms, light shading more than 2000 fathoms, dark shading.

no great distance from its eastern coast, rapidly deepens to 2000 fathoms or more, yet this is only in a channel that separates Madagascar from a platform of about half that depth, on which are based the volcanic Mascarene Islands (Mauritius, Bourbon, and Rodriguez), and of which a northern extension forms the base of the Seychelles group. This platform then curves to the south-west, so as to pass round the north of Madagascar, forming the base of several coral islands, and thus comes into continuity with the bed of the Mozambique Channel, from which the Comoro group arises. To the north of this platform, the 2500 fathom line follows the trend of the African coast as far as Cape Gardafui, keeping outside the island of Socotra; and a bottom of more than 2000 fathoms (crossed by the telegraph-cable between Aden and Bombay) extends into the Arabian Sea as far as 15° N. lat. On the eastern side of that gulf, however, the declivity from the Indian coast-line to the deepest part of the basin is much more gradual; the Maldive and Laccadive groups of coral islands rising from a comparative shallow, which extends itself a little to the south of the equator. And about half way between this platform and that of the Seychelles the bottom rises into the bank which bears the Chagos archipelago, and which divides the communication between the deeper portion of the general basin and that of the Arabian Sea into two channels of no great width. Though the 2500 fathom line does not enter the Bay of Bengal, a considerable portion of it has a depth exceeding 2000 fathoms. Here, again, the declivity is more gradual along the eastern margin of the gulf; and the Andaman and Nicobar Islands arise from a comparatively shallow platform that stretches between the delta of the Irawadi and the north end of Sumatra.

Surface and Bottom Temperature.—The surface-temperature of the Indian Ocean is higher than that of either the Atlantic or the Pacific; and this difference shows itself especially in its northern division, on which the proximity of tropical land exerts an important thermal influence. For the mean annual temperature of the portion which lies between the equator and the Tropic of Cancer, including the Arabian Sea and the Bay of Bengal, is considerably above 80°, whilst that of the corresponding part of the southern division—lying between the equator and the Tropic of Capricorn—ranges from 80° to 70°, the average maximum temperature in the centre of the Arabian Sea being 87°. In July the thermal equator moves considerably to the north, and the surface-temperature sometimes rises in the Arabian Gulf and the Bay of Bengal to above 90°. In January, when the thermal equator lies to the south of the geographical, the temperature of these two gulfs falls below 80°, while that of the vast expanse which lies between the parallel of 10° N. and 25° S., has a temperature of 80° or upwards. In the southern hemisphere the January (summer) isotherm of 70° and the July (winter) isotherm of 60° correspond pretty closely with the border of the Indian Ocean,—the range of its temperature being thus very moderate.

The bathymetrical isotherms of the Indian Ocean have not yet been systematically worked out by temperature-soundings; but there is adequate evidence of the extension of the Antarctic underflow over the deeper portion of its sea-bed, even to the north of the equator. For the "Hydra" line of soundings between Aden and Bombay gave a bottom-temperature of 36°·5 at a depth of 1800 fathoms, the surface-temperature being 75°, while in the deep depression on the eastern side of the basin, almost immediately beneath the equator, Commander Chimmo met with a bottom-temperature but little above 32°.

Surface-Level.—A very remarkable effect is produced upon the coast-level of part of the northern division of the Indian Ocean, by the attraction of the great mountain-masses and high table-lands of Central Asia, uncompensated by that of any elevated land-mass to the southward, nearer than that which may lie behind the Antarctic ice-barrier. From the results of the great geodetical survey of India Archdeacon Pratt was able to deduce the very remarkable fact that the level of the sea at the mouth of the Indus is no less than 515 feet higher than at Cape Comorin.[1]

Currents.—The current-system of the Indian Ocean is clearly dependent upon the winds which prevail over its several parts,—the seasonal reversal of the monsoons in the northern part of its area producing a corresponding modification in the direction of the surface-movement of its water, whilst in the southern division the constancy of the south-east trade-wind keeps up through the whole year a strong westerly equatorial current. The north-east monsoon has, of course, while it lasts, the same effect as a north-east trade-wind would exert, in producing a general south-westerly drift over the northern division of the Indian Ocean, which manifests itself in a southerly flow along all the shores it meets, viz., the south-east coast of the Indian peninsula, the south-east coast of Arabia, and the east coast of Central Africa. Besides this, a special current-movement is produced by the action of the north-east monsoon on the surface-water of the China Sea, by the drift of which to the south-west it is forced into the channel between the Malay Peninsula and Sumatra, whence it issues into the Indian Ocean, through the Strait of Malacca, as a current that crosses the Bay of Bengal and impinges against the Coromandel coast of India. By this it is deflected southwards, along with the general drift already mentioned, and then courses round the southern angle of the great peninsula,—partly between Ceylon and the mainland, and partly along the outer coast-line of Ceylon,—into the Arabian Sea, where it merges into the general drift of the surface-water towards the African coast. The average rate of this current, as it issues from the Strait of Malacca, is 30 miles per day; along the south-east coast of India, 24 miles; on the east coast of Ceylon, 40 miles; and along the Arabian coast, 18 miles. But when the north-east gives place to the south-west monsoon, about the vernal equinox, the whole of this movement is reversed. The drift then commences from the African and Arabian coasts, and sets across the Arabian Sea, at the rate of about 24 miles a day, to the Malabar coast of India, along which a current flows in a southerly direction at the rate of about

[1] *Philosophical Transactions*, 1859, p. 795.

30 miles a day. This current rounds Cape Comorin and the southern coast of Ceylon, where it sometimes attains the rate of 45 miles a day, and passes into the Bay of Bengal, reinforcing the general north-east movement of its own water, circulating round the head of this gulf, and then undergoing a deflexion by the coast-line towards the entrance of the Strait of Malacca, into which it flows at the rate of from 20 to 24 miles per day. When the sun crosses the equator towards the south at the autumnal equinox, so that its heating power is exerted on South Africa, the indraught of air towards that continent reproduces the north-east monsoon; and this restores the westerly drift, which extends over the Indian Ocean as far as 5° S. lat., giving place at about that parallel to the equatorial counter-current.

The surface of the southern Indian Ocean, between the parallel of 10° S. and the Tropic of Capricorn (the precise limits varying with the season), is pretty constantly traversed by the south-east trade-wind, which gives a steady westward movement to its water, known as the south equatorial current, whose average rate is about 14 miles per day. This meets the eastern coast of Madagascar, and that of continental Africa to the north and south of it; and, its onward flow being thus checked and deflected southwards by the trend of the land, it forms a strong current which sets along the Natal coast towards Cape Colony. The strength of this current varies according as the north-east or the south-west monsoon is blowing; for the movement produced by the former reinforces it, while that produced by the latter weakens it, by deflecting northwards a portion of the water which the southern equatorial current brings to the coast of Africa, and drifting it towards the Indian peninsula. When flowing with its greatest force and velocity, the Natal current[1] is scarcely, if at all, inferior to the Gulf Stream where it issues from the Florida Strait. When passing Cape Corrientes, at the southern extremity of the Mozambique Channel, it is said to have a rate of 80 miles per day, and has been even said to rush, under a rare combination of impelling forces, with a velocity of 140 miles per day. Its rate gradually diminishes, however, until, off Cape Colony (where it is known as the Agulhas current), it has a velocity of about 50 miles per day. The warmth it carries has a very important influence in ameliorating the climate of Cape Colony; for this would otherwise suffer from the importation of the low temperature brought by the Antarctic current which there meets it.[2] When the Agulhas current is at its strongest, it carries a temperature of 79° as far west as the meridian of 15° E. But when the drift of the monsoon wind countervails that of the south-east trade, instead of reinforcing it, the temperature of the Agulhas current is lower and its force less. Whilst a portion of this current rounds the Cape and becomes a tributary of the South African current of the Atlantic (thus carrying away the excess brought into the basin of the Indian Ocean by the Malacca current), the principal part of it is deflected to the south and east, partly by the agency of the Antarctic current, but chiefly under the influence of the westerly winds or "anti-trades," that prevail throughout the southern water-zone which almost continuously girdles the globe between the parallels of 40° and 60° S. Thus there is here a pretty constant retrograde set of surface-water (corresponding with the southern connecting current of the South Atlantic), at the rate of about 24 miles a day, towards the western coast of Australia; and since, notwithstanding the reduction of its temperature, the water which has circulated in the Indian Ocean is still much warmer than that which forms the general mass of the easterly drift, it is probably through this excess (imparting a corresponding excess of vapour to the atmosphere above, which is condensed again by contact with the colder land) that the fogs are generated, for which the islands that lie in the course of this flow are notorious. On arriving at the shores of Australia, this drift is divided by the south-west projection of its coast-line into two streams, one of which continues its eastward course along the southern coast, whilst the other, turning northwards, forms the West Australian current, of which the greater part, when it reaches the head-water of the southern equatorial current, is drawn into it, and thus completes the circulation of the southern Indian Ocean.

Between the parallel of 5°, to which the influence of the monsoon winds extends, and that of 10° S., which is the usual northern limit of that of the southern trade, there is a "belt of calms," wherein there runs an equatorial counter current, which corresponds to that of the Atlantic, and is, like it, to be considered as a back-water flowing towards the source from which the currents to the north and south of it derive their supplies. (W. B. C.)

[1] This is commonly termed the Mozambique current; but, as the usual southerly direction of the surface flow in the Mozambique Channel is liable to reversal with the change from the north-east to the south-west monsoon, or even under the influence of local winds, the term Natal current (suggested by Mr Laughton) seems decidedly preferable.

[2] Some very curious temperature phenomena are produced on the Agulhas bank by the splitting up of the cold and warm currents, which form distinct bands and strata that do not mix for some time.

INDIANS, American. The application of the name Indians to the native peoples and tribes of the New World is an erroneous usage, originating in the belief of the Spanish discoverers of America that they had reached the eastern shores of Asiatic countries already partially known. As it happens, the name is now, even apart from the addition of American, customarily applied to the aborigines of the western hemisphere, while it is used with far less frequency as a collective name for the inhabitants of the great country of the East known from the remotest times as India.

Various questions in regard to the American Indians have been discussed in the article America. It is here intended to treat more particularly their ethnographical position, and to give what may be called a working classification of the races. This is followed by a separate notice of the present distribution and condition of the North American Indians.

It may be asserted with some confidence that there is nothing in the physical and mental condition of the aboriginal Americans which requires us to postulate for them a foreign origin. If man was evolved originally from several centres, America assuredly included one at least; if he sprang from a single pair, then we can even conceive that pair to have been first established in the New World, and the arguments brought forward in support of an Asiatic origin of the American would not lose their point if adduced in favour of an American origin of the Asiatic peoples.

Andreas Retzius, the founder of scientific craniology, arguing on insufficient materials, grouped all the American aborigines in two great divisions—(1) a western or highland, occupying the main ranges of the Rocky Mountains and Andes, with the intervening lands thence to the Pacific; and (2) an eastern, mainly lowland, whose domain stretched from the western uplands to the Atlantic seaboard. The former, being characterized by brachycephalous or round heads, he felt disposed to connect with the brachycephalous Mongolians and Malays of Asia and Australasia. The latter, being of a decided dolichocephalous or long-headed type, he traced to possible Berber and Guanche migrations from north-west Africa and the Canary Islands, doubtless because the historical arrival of the dolichocephalous Norsemen in the New World was of too recent date to serve his purpose. But Virchow ("Anthropologie Amerika's," in *Verhandlungen der Gesell. für Anthropologie*, 1877, p. 144–56) has amply shown that this classification is untenable, and it will be seen further on that there are long and round-headed types often intermingled in every part of the continent. Virchow himself, while denying the claim of the American race to be considered autochthonous, declines to commit himself as to the probable regions whence they may have reached their present habitat. The theory of an Asiatic immigration *via* Behring Strait has been somewhat revived since ethnologists have, so to say, rediscovered the lost Tchuktchis of the north-east coast of Siberia through Nordenskjöld's Swedish polar expedition of 1878–9. These Tchuktchis are supposed to form the connecting link between the races of the two worlds, and the supposition is strengthened by the *invention* of an American branch of the tribe. Professor Nordenskjöld himself remarks that "this race, settled on the primeval route between the Old and the New World, bears an unmistakable stamp of the Mongols of Asia and Eskimo and Indians of America" (Petermann's *Mittheilungen*, 1879, p. 330). But Lieutenant Palander of the same expedition says that "they undoubtedly descend from the Greenland Eskimo" (*ib.*), which would at once deprive them of all value as a connecting link, while Peschel (*Races of Man*, p. 391) much more probably allies them to the Itelmes (Kamtchadales), the two languages being "as closely related as is Spanish to Portuguese." W. H. Dall (*Contributions to American Ethnology*, vol. i., Washington, 1877) further points out that the Innuit (Eskimo) tongue, said to be spoken by the Tchuktchis, is merely a trading jargon, a mixture of Koriak, Tchuktchi, Innuit, English, Hawaiian, and others. It is also to be noted that the Samoyedes and other Asiatic Arctic peoples, assumed by many to be the progenitors of the Eskimo, are of Mongoloid stock and distinctly brachycephalous, while the Eskimo are the most dolichocephalous race on the globe next to the Kai Colos of Fiji (Flower). Thus the Eskimo, instead of being a connecting link, form an anthropological barrier between the populations of the two hemispheres at the very point geographically most convenient for effecting the transition.

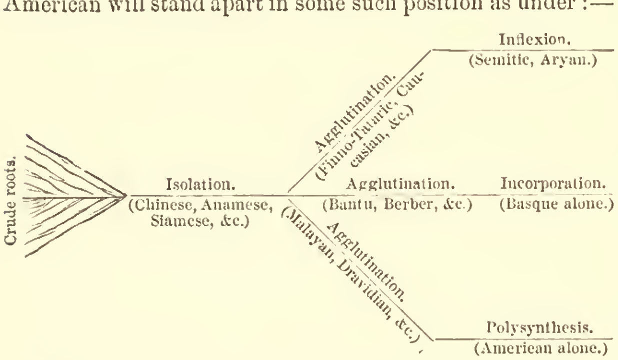
Nor would the question be much furthered by allowing the arrival of a few barbarous tribes *via* Behring Strait in prehistoric times. Their presence would leave the Aztec, Mayan, Peruvian, and other local cultures unexplained, except as independent developments. And more recent historic migrations of Chinese, Japanese, and other civilized peoples, otherwise involved in tremendous difficulties, would leave equally unexplained the primeval mound-building races of the Ohio valley and the still more ancient Brazilian races of the Santa Catharina and Santos shell-heaps. Because a stray vessel has been cast ashore on the western seaboard since the discovery of America, Virchow suggests the possibility of similar arrivals in remoter times. But if the Chinese arrived so recently as even 8000 years ago (an extreme supposition) in sufficient numbers to build up a civilization in Central America, the Chinese origin of such a civilization would to this day be as self-evident as is the Chinese origin of the neighbouring Japanese civilization. The foreign founders of these communities would necessarily have brought with them their arts, their domestic animals, their more useful plants and cereals, without which they must have themselves speedily perished or been absorbed in the surrounding native populations. But no trace of these things was found in the New World on its discovery. There was neither the rice of the Chinese, nor the wheat, barley, oats, or rye of the Western nations, nor the iron now proved to have been known to the ancient Assyrians and Egyptians, nor the horse, camel, ox, sheep, pig, dog, or poultry of the eastern hemisphere. Instead of these, there was little beyond one cereal (maize), one esculent root (potato), one feeble beast of burden (llama), limited to the uplands of the southern Cordilleras, one species of dog elsewhere unknown. Most of the useful plants and animals of the East have since been introduced, and flourish vigorously even in the wild state, a sufficient proof that they would have been propagated had they been introduced at an earlier epoch. The knowledge of metals was limited to copper, both wrought and, in Wisconsin, apparently cast (J. S. Butler), bronze, lead, gold, and silver. Otherwise most of the nations were at the discovery still in the Stone Age; and, although Virchow's assertion may be true that the most practised archæologist will fail to detect any material difference between the stone implements of the two hemispheres, this merely implies that the arts of Palæolithic and Neolithic man were pretty much the same everywhere.

Nor is there anything in the religions, systems of government, architecture, and other arts of the native Americans, by which they can be connected with the corresponding systems of the East. That the Toltec builders of the low obtruncated Mexican pyramids were a different people from the pyramid builders of the Nile valley, and that the mummies of the Ancon necropolis and other parts of Peru were of a different stock from the Egyptian mummies, is sufficiently evident from the texture of the hair alone. The hair of the old cultured races of America was the same as that of all the later American races, uniformly lank, because cylindrical in section. The hair of the old Egyptians, like that of the modern Fellahîn, is, on the contrary, uniformly wavy, because more or less oval in section. The religions, again, of the Red Man, we are told by Carl Schultz-Sellack, Oscar Loew, and other good observers, are "essentially astrological, based on star, sun, and moon worship," with which was often associated an intricate method of measuring time built on a series of twenty constellations" (*Zeitschr. für Ethnologie*, 1879, p. 209). "The sun," says Loew, "is the god of most Indian tribes. 'He diffuses warmth and nourishment for us and our animals; why shall we not worship him?' observed to me on one occasion Masayamtiba, a Moqui Indian (New Mexico)" (*ib.* p. 265). This Masayamtiba was a better philosopher than those ethnologists who seek for the origin of such a simple cult in the remote corners of the globe, rather than in the beneficial influence of the heavenly bodies which shine alike for all mankind. The four great gods of the Mayas, the "props of the heavens," answered to the four great Mexican gods of the four quarters of the compass, all being associated with the four elements of wind, water, fire, and earth. But to what does either system answer in the polytheistic creeds of the Hindus, Assyrians, Babylonians, or other nations of antiquity? There is something similar in the Neo-Buddhistic teachings; but Buddhism, even of the oldest type, is much too recent to explain anything in the religious worlds of Mexico or Yucatan. The hare is associated in America, in Asia, and even amongst the Bushmen of South Africa with the moon. But this association was obviously suggested independently by the spots which, especially in the first quarter of the moon seem to present the outlines of a hare on its form. Waitz (*Anthropology*, p. 255) well observes that a common belief in a universal flood, or in the periodical destruction of the world, whether by fire, water, storms, or earthquakes, and analogous or parallel lines of thought—taken individually—afford no proof whatever in favour of affinity, and even resemblances in several points possess only a secondary importance; for they may partly, under like conditions, arise spontaneously among peoples who have always lived in a state of separation, or may have partly resulted from periods of short intercourse between two different peoples.

In any case, these slight coincidences are of little account when weighed against the argument based on diversity of speech. The tremendous force of this argument, as applied to the American aborigines, is scarcely realized by anthropologists such as Waitz or Virchow, who have not cultivated philological studies, and it is significant that, in the already quoted paper by Virchow on the "Anthropology of America," the linguistic element is not even referred to. On the other hand, it has been greatly depreciated and even brought into contempt by the vagaries of certain etymologists, who discover affinities where there is nothing but the vaguest verbal resemblance.[1] Science has demonstrated beyond all cavil that, while differing widely among themselves, the American languages not only betray no

[1] It may be sufficient to refer to the series of papers by Mr John Campbell of Montreal on the "Hittites in America," which have recently appeared in the *Canadian Quarterly Journal of Science*, and which on the most fanciful grounds connect the native idioms not only with each other but with most of the known languages of the universe. Thus Iroquois and Peruvian are declared to be radically one, while the former is connected with Basque, Dakotan with Circassian, Accad with Japanese, and a general Khita linguistic family is made to include, besides all these, Choctaw, Cherokee, Aleutian, Fuegian, Aino, Kamtchadale, Tchuktchi, Haussa, Barabra, and many others in every part of the world.

affinity to any other tongues, but belong to an absolutely distinct order of speech. They are neither isolating or monosyllabic like the Indo-Chinese group, agglutinating like the Ural-Altaic, Bantu, or Dravidian, nor inflexional like the Semitic and Aryan. They come nearest in structure to the Basque, which is the only incorporating language of the Old World, but differ from it essentially inasmuch as their capacity of incorporating words in the sentence is not restricted to the verb and a few pronominal elements, but extends in principle to all the parts of speech. This faculty, which, with one or two doubtful exceptions, seems to be characteristic of every American idiom from Behring Strait to Cape Horn, has received the name of polysynthesis, literally "a much putting together." [1] Hence, in a comprehensive classification of articulate speech according to its inner mechanism, a special place must be reserved for the American group; and, if we assume as the most probable theory that all speech has slowly evolved from a few simple beginnings, passing successively from the state of crude roots to the isolating condition, and so onwards to the agglutinating and other orders, then in such a scheme the American will stand apart in some such position as under:—



Here it is not intended to imply that American derives from Malayan or Dravidian, but only from some now extinct agglutinating forms of speech of which Malayan or Dravidian may be taken as still surviving typical instances. The disappearance in America of all such assumed forms, unless the Otomi of Mexico is to be accepted as a solitary lingering specimen, argues both a very great antiquity and an independent evolution of the American languages. And as the course this evolution has taken differs entirely from that pursued by the idioms of the Old World, it follows that the first peopling of America, if from the Old World, must be thrown back to a time when all speech itself was in its infancy, to a time when slow diffusion might be conceived as equally probable from an eastern or a western starting-point. It is this feature of polysynthesis that gives the American race its first and greatest claim to be regarded as truly autochthonous, in the same sense that we regard the Mongolian and Caucasian races as truly autochthonous in Asia.

There is a general consensus amongst anthropologists that on the western continent we are in presence of two distinct original types, the brachycephalous and dolichocephalous. But these are no longer confined to separate geographical areas, as Retzius supposed. The very general practice of artificially flattening or otherwise deforming the skull has naturally caused less value to be attached to the craniological test in America than elsewhere. The practice has been traced back even to prehistoric times, and a clay figure recently found associated with the remains of a child by Reiss and Stübel in a grave in Ancon puts in a clear light the method adopted by the ancient Peruvians (*The Necropolis of Ancon*, Berlin and London, 1881, plate 90). Still, careful investigations have placed it beyond doubt that the normal skull both in North and in South America is now mesaticephalous, or of a type intermediate between the two extremes, a fact supposed to imply a general intermingling of the two primeval stocks. On the other hand, Virchow (*loc. cit.*, passim) shows perfectly normal ancient and recent crania from both sides of Greenland, from El Carmen on the Rio Negro, Patagonia, from the Botocudo tribe, East Brazil, from a tumulus of Santa Fé de Bogota, and even a Peruvian mummy exhumed at Pancatambo, all of which are distinctly, in some cases extremely, dolichocephalic. In the same way he produces brachycephalic skulls from the Brazilian shell-mounds of Santos and Santa Catharina, from the barrows of the Ohio valley mound-builders, from the Carib and Araucanian tribes, and from the Pampas of La Plata, the last mentioned of an extreme type, in close proximity to the extreme dolichocephalous specimens from Patagonia. Were it safe to argue from the analogy of Britain, where the dolichocephalic builders of the long barrows seem to have preceded and afterwards become intermingled with the brachycephalic builders of the round barrows (Dr Thurnam), the western continent might be supposed to have been successively occupied first by a long-headed and then by a round-headed race, which kept aloof in a few places, while more generally becoming fused in a normally mesaticephalic type. But we have in America no guide to the relative priority of the two forms of head, nor are there now any long-headed races on the eastern Asiatic seaboard whose ancestors might be taken as the precursors of the corresponding element in the West. The obvious alternative also remains, that the two forms may have become differentiated on the American continent, just as similar differentiations must, by those who do not accept the doctrine of fixity of species, be assumed to have taken place in Asia. For such an evolution America offered a more ample field even than Asia, for it is not confined to the northern hemisphere, but stretches from the Arctic nearly to the Antarctic Circle, presenting in this wide range almost every conceivable variety of climate, atmosphere, soil, and temperature.

We thus see that the two cranial forms do not necessarily militate against the possible primordial unity of the *homo Americanus*. This unity seems on the other hand implied in certain physical and mental features, common to all the native races. Of the physical traits the most important and uniform are—(1) the hair, which is always black, coarse, glossy, and long, like a horse's mane, round in transverse section and persistent to extreme old age; [2] (2) slight beard, but always straight, never wavy; [3] (3) eyes small, black, somewhat deep-set, always horizontal; [4] (4) eyebrows narrow, very arched, and black; (5) prominent cheek bones and nose, the latter often very long and aquiline. [5]

The native American being popularly spoken of as "The Red Man," it might be supposed that colour should be included in this brief list of common characteristics. But, notwithstanding the general impression, there is perhaps no

[1] Abel Hovelacque (*Linguistique*, Paris, 1877) has endeavoured to confound polysynthesis with agglutination; but A. H. Keane (Appendix to Stanford's *Central and South America*, 1878) has shown that the difference between the two is fundamental, and Prof. Sayce (*Science of Language*, 1880) has finally adopted this view.

[2] During the many years that he lived in South America, D'Orbigny assures us that he "never met a bald native of full blood" (*L'Homme Américain*, i. p. 128).

[3] The only known exception are the Guarayos, a Guarani tribe, originally from Paraguay, now in the Moxos missions, altogether a remarkable people, whose quasi-European complexion and appearance are heightened by a very full but always perfectly straight beard.

[4] Except amongst the Guaranis, the outer angle of whose eyes is generally pointed upwards, giving them a Mongolian cast.

[5] But this feature is not constant, for the nose of many Pampas and Guarani tribes is often very short, broad, and flat.

other region of the globe where so great a variety of colour prevails. The more general tints are a copper or cinnamon brown, and olive yellow; but the subjoined table of tribes, grouped according to their colour, shows that the extremes of a deep brown almost approaching a true black, and of a light or fair hue almost approaching a true white, also occur, altogether independently of latitude, climate, or elevation of the land:—

Leather Brown, Coppery, Cinnamon.	*Dark Brown to Blackish.*	*Olive-Brown and Yellowish.*	*Fair to Whitish.*
Iroquois: New York, Canada. Algonquins: north-east States, U.S.	Gualcuri, Pericui: Lower California. Charruas: Uruguay	Guarani: Brazil, Paraguay. Coroados (women): Minas Geraes Puris (women): Rio Janeiro.	Pehuenches, Boroanos: Chili, 35° to 40° S. Tocomonas: Beni river, Bolivia.
Chiriguanas (settled): Pilcomayo river. Coroados (men): Minas Geraes. Puris (men): Rio Janeiro.	Coast Arawaks: Guiana. Quichuas: Peru. Aymaras: Bolivian uplands.	Aucas: Chili, east slopes of Andes. Rangueles: Chilian pampas. Chiquitos: between Paraguay and river Negro.	Hydas: Queen Charlotte Islands. Cayawas: Rio Branco, river Mamore, Brazil. Pammas: Madeira river, Brazil.
Araucanians: Chili. Fuegians: Tierra del Fuego. Mataguayas: Gran Chaco.	Payaguas: Paraguay. Yaros: east side of Uruguay river. Charruas: Uruguay.	Otukes: north-east Bolivia. Tupi, Tupinamba: north-east Brazil.	Aguanos, Barbudes: Huallaga river. Inland Arawaks: Guiana.
Maropas, Apolistas: Moxos, Bolivia. Vilelas: Vermejo river, La Plata.	Puelches: Pampas, La Plata. Tehuelches: Patagonia. Changos: coast of Peru.	Moxos, Itonamas, Cayubabas: prov. Moxos, Bolivia.	Chiriguanas (wild): Pilcomayo river. Yuracares: Bolivian plains. Tacanas: Beni river, Bolivia.
Mbocobis, Tobis: Gran Chaco. Pilcomayo river. Abipones: west bank of upper Parana.	Atacameños: Tarapaca, Peru. Quichés: Guatemala lowlands Galibi: Guiana.	Botocudos: Brazilian coast range. Timucua, Seminoles: Florida.	Blackfeet: Saskatchewan river. Mandans: Middle Missouri. Guarayos: Moxos, Bolivia.
Dakotas: Upper Missouri. Apaches: North Mexico, Arizona. Quichés: Guatemala uplands.	Minnanes: between rivers Parana and Uruguay. Bohanes: Lower Urugnay river.	Eskimo: Arctic seaboard. Unalaskans, Akkhas: Aleutian Islands.	Mosetenos: river Beni, Bolivia. Guarives: Venezuela. Siriones: Moxos, Bolivia.

Similar tables might easily be drawn up of stature, varying from the dwarfish Eskimo, Fuegian (mean 5 ft. 1 in.), and Peruvian (mean 4 ft. 9 in.) to the gigantic Patagonian, the tallest race on the globe.

No less varied are the other physical traits, while the wide divergence of mental capacity is sufficiently indicated on the one hand by the Cherokees of the southern Alleghanies, who in 1824 invented a complete syllabic writing system, and who can reckon to a million and upwards, and on the other by the Chiquitos of the Bolivian lowlands, who, D'Orbigny assures us (*op. cit.*, ii. p. 163), "cannot get beyond one (tama), after which they have nothing but terms of comparison." The only real intellectual faculty common to all the American races is that implied by the peculiar polysynthetic mechanism of their speech. But beneath this general morphological structure, the substance of the languages themselves varies greatly in all that concerns their phonetic systems, vocabularies, relational forms, syntax, and methods of combination. While, for instance, the Thlinkeet of the extreme north-west Pacific seaboard, the Apache of Arizona, the Quichua of Peru, and the Aymara of the Bolivian uplands are amongst the very harshest and most guttural tongues in the world, the Otuke of the Bolivian plains, the Mohave of Arizona, the Chiquito of the upper Paraguay basin, the Samucu on the north frontier of Gran Chaco, and many Amazonian dialects are distinguished by great softness, often rivalling in euphony the most musical languages of the eastern hemisphere. The linguistic families differ from each other, not only in the measure to which their polysynthesis has been developed, but even in its very character, so that while some have scarcely yet arrived at a clear differentiation of verb and noun, others, like the Iroquois, have a purely verbal, others again, such as the extinct Timucua of Florida, an exclusively nominal inflexion. In the same way some are partial to prefixes, some to suffixes, some to infixes. Many of the Californian idioms seem to be still verging on the agglutinating stage, while the just-mentioned Timucua, the Aztec, Choctaw, Shoshone, Cree, Matlalzinca, and others of the Anahuac table-land, have reached the very acme of polysynthesis, in which all the parts of the sentence often become by indefinite composition and syncope fused into one interminable "bunch-word" of from ten to fifteen syllables and upwards. As these languages also differ entirely in their vocabularies, often possessing not a single root in common, it follows that they can be no more classed together than can for instance the various agglutinating tongues of the Caucasus or the Soudan.

It thus appears hopeless to look for any unity of details in the mental and physical faculties of the American aborigines. What they have in common is reducible to one physical and one mental quality, the universal texture and black colour of the hair, and their polysynthetic speech. These two properties point directly at primordial unity of origin; the endless varieties of detail argue a prodigious antiquity and an independent development of the race on the American continent. The variety renders the work of classification a labour of extreme difficulty and uncertainty. Amidst all these endless points of divergence, it seems impossible to find any common basis round which to group the various tribes and races, and the problem becomes further complicated by the fact that, while many of these tribes differ in speech, though evidently of one racial stock, others belonging to the same linguistic connexion present the widest physical discrepancies. Thus the Chiquitos and the Moxos peoples of Bolivia, obviously of one ethnical type, speak several fundamentally distinct languages. The same is true of the Moqui, Queres, Isletta, Tegua, Zuñi, and other New Mexican Pueblos, while the reverse phenomenon is presented by the Montagnais and Nasquapees of Labrador, both of whom speak closely related Cree dialects, yet differ so much in appearance that, "judging from their exterior, one would suppose them to belong to different families of the human race" (Hind's *Labrador*, i. p. 332). Within comparatively narrow areas occurs occasionally every conceivable element of confusion, as in California and the south-western States, occupied by the morally debased and physically degraded Pah-Utes, the tall and manly Mohaves, the ferocious Apaches, the mild and intellectual Indians of the New Mexican Pueblos, some fishers and hunters, some living on roots and berries, some skilled agriculturists, all speaking fundamentally distinct languages.

It is evidently impossible in such a case to adhere throughout to any one method of classification, and the following tentative survey is consequently based partly on the linguistic and partly on the ethnical elements, but partly also on mere geographical grounds. Fortunately there are in all the divisions of the continent a few great families, occupying vast regions, in which the ethnical and linguistic elements largely coincide. Foremost amongst these are the sub-arctic races and the Athabascans, Algonquins, and Dakotas in the north, the Maya-Quiché in the centre, and in the south the Caribs, Quichua-Aymaras, and Guaranis. These eight stocks cover jointly an area of not less than 11 millions of square miles, with a total aboriginal population of about four millions. But the seven millions of pure and mixed Indians occupying the remainder of the land, 5 millions of square miles in extent, are divided into a multiplicity of tribes, whose racial and linguistic affinities present problems the solution of which must long tax the utmost ingenuity of science. The total number of distinct languages alone is estimated at about 760, of which 430 are in the north and 330 in the south. In the northern division Balbi reckons, exclusive of California, thirty-two stock languages, far too low an estimate, while Rivero and Tschudi consider that of the southern idioms as many as four-fifths are radically distinct. But all such calculations are mere vague guesses at the truth; and in the present state of our knowledge it is impossible to form an estimate of the actual number of languages still current in Gran Chaco, Chiquitos, the Amazon valley, Central America, Mexico, California, the Columbia basin, regions where an extraordinary complexity of speech prevails. Nevertheless language forms on the whole perhaps the most convenient basis of classification, and without its aid it would have been impossible to determine the affinities of many wide-spread races, such, for instance, as that of the Arizona Apaches with the Canadian Chippewyans, or on the other hand to separate nations apparently closely related, like the Iroquois from their Algonquin neighbours, or the Araucanians from the Peruvians. The true relations of many tribes are, on the other hand, still doubtful, because of uncertainty regarding the languages they speak. Such are the Cheyennes, Blackfeet, and Arapahoes, classed by some with the Dakotas, by others more probably with the Algonquins. Such also are the so-called Diegueños (Kizh, Netela, and Kechi) of South California, oscillating between the Shoshone (Snake) and Yuma connexions, and the Pawnees of Nebraska and Kansas grouped by Bancroft with the Shoshone, but by Morgan regarded as an independent race. So close is the physical resemblance in these and many other cases that the question must ultimately be decided by a more exhaustive study of their languages.

The American races may be conveniently grouped under the following eighteen divisions :—

I. *Hyperborean Races.*—This division may on the whole be regarded as possessing a certain ethnical, linguistic, and geographical unity. Still the Aleutians differ so greatly in language, and in some respects in type, from the Eskimo proper that it seems desirable to class them separately. The *Eskimo* (or "Innuits," as they call themselves) are thus distributed by Dall :—

Kopagmut, mouth of the Mackenzie; Kangmâligmut, thence to Manning Point; Nūwukmut, about Point Barrow and Icy Cape; Kowagmut, east end of Hotham Inlet; Salawigmut, at Salawik river; Chuklukmut, Gulf of Anadyr, Asia, often confounded with the Tchuktchis, from whom they are entirely distinct; Okee-ogmut, the islands north of 63° N. lat.; Kikhtogamut, St Lawrence Island; Kaviagmut, between Kotzebue and Norton Sounds; Mahlemut, neck of Kadiak Peninsula; Unaligmut, from Norton Sound to mouth of the Yukon; Ekogmut, Yukon Delta; Magemut, from Yukon to Kuskokwim river; Kuskwogmut, Kuskokwim Bay; Nushagagmut, Bristol Bay, west to Cape Newenham; Ogulmut, north side of Alaska peninsula; Kanlagmut, south side of Alaska peninsula and Kadiak Island; Chugachigmut, Prince William's Sound to Atna river; Ugalakmut, from Atna river to Mount St Elias.

The last-named, the Ugalenzes of the Russians, call themselves Chilkhatmut, and are undoubtedly true Eskimo, although frequently confounded with the Thlinkeets, on whose domain they converge. The few Innuit tribes east of the Mackenzie have not been classified, but two of them, the Netchillik and Uquîsiksillik, were met by Lieut. Schwatka in 1879, who received from them some particulars regarding the remains of the Franklin expedition.

Of the Aleuts, whose collective name is "Ungungun," or "People," there are two divisions :—

1. *Unalashkans*, who call themselves Kagataya Kung'n ("Men of the East"), occupying the extremity of the Alaska Peninsula, as far as 160° W., and the Unalashka or Fox Islands. 2. *Atkhas*, occupying all the other Aleutian Islands.

II. *Thlinkeets.*—These form a distinct ethnical and linguistic group, occupying a compact geographical area along the Pacific coast from about Mount St Elias to the Simpson river, and including Sitka and the other adjacent islands. They are often called "Koloshes," a term of doubtful origin, but the national name is "T'linket," "man," or "T'linketantûkwan," "men belonging to all villages." The tribal divisions are :—

Yakutat, between Mounts St Elias and Fairweather; Chilkahtkwan, Chilkhaht river valley; Sitkakwan, Sitka Islands and part of Prince of Wales Islands; Stâkhinkwan, lower course of Stikine river; Takukwan and Skatkwan, Taku Inlet, Alaska; Hudsunu, Hood's Bay and Huchinu Rapids; Hiknu and Tungass, about Simpson river.

The Thlinkeet language seems to be completely isolated, showing nothing beyond the faintest verbal resemblance to the Aleut and more southern Hydah. It has a plural in *k*, and an instrumental form in *tch* or *tsh*, the combination of which produces a heaping up of final consonants, which none but the natives can pronounce. Thus *ass*, tree; *asstsh*, by a tree; *isk*, trees; *assktsh*, by trees. (See "Notes on the Sitkakwan Dialect," by J. Furnhelm, in *Contributions to American Ethnology*, vol. i.)

III. *Columbian Races.*—The general grouping of these is purely geographical, the main divisions largely ethnical and linguistic; the area, British Columbia, Queen Charlotte and Vancouver Islands, Washington, and Oregon. Here are five stock races speaking an immense number of dialects, which, owing to their extremely evanescent character, it is very difficult to classify. The Puget Sound district, in the north-west of Washington, is in this respect specially remarkable. But great light has recently been thrown on this Babel of tongues by the labours of G. Gibbs, published by Dall, in *North American Ethnology*, vol. i. p. 240. The five stock races with their chief tribal subdivisions are as follows :—

1. *Hydahs.*—The Kaigani of Prince of Wales Islands and north coast of Queen Charlotte Islands; the Klue, Kiddan, Ninstence, Skid-a-gate, Skid-a-gatee, Cumshe-was, and Chut-sin-ni of Queen Charlotte Islands; and the Tsimsians, including the Kispachloht of Fort Simpson, the Kl'kuskamoluk of river Naas, and the Kittistzu, Hailtzukh, Bilikûla, and Kwa-Kiûtl of Milbank Sound. 2. *Nutkas.*—The Ahts, including Pachînaht, Nitinaht, Ohyaht, Howchuklisaht, Klah-oh-quaht, Manohsaht, Nishquayaht, Ayhuttisaht, and Khahosaht, on the west coast of Vancouver Island, in their order going northwards; the Maka or Klasset, about Cape Flattery; and the Quoquoulth, Komux, Kowitchan, Klallum, Ukletas, Sokes, Pachina, and Sankaulutuch, of the east coast of Vancouver Island. 3. *Selish or Flat Heads.*—The Kwantlum and Haitlin or Tait, Fraser river below Fort Yale; the Kalispelm, Quarlpi, Spokane, Pisquouse, Soaiatlpi, of middle Columbia basin; the Nisqualli (including the Skokomish, S'hotlmamish, Sawamish, Segwallitsu, Puyallupahmish, Dwamish, Snohomish, Snokwalmu, Yakama, Skagit, Lummi, and S'klallam) of Puget Sound; the Chihalis or Tsihalis, Grey Harbour; and the Shushwaps (including Shewhapmuch, Kutenais, and Okanagan) of Upper Columbia. 4. *Sahaptins or Nez Percés.*—The Taitinapam, right bank of Columbia to Adam's Mount; the Klikatat, about Mount St Helens; the Yakima, Yakima Valley; the Walla Walla, Palouse, Tairtla, Cayuse, and Mollale of upper Clear Water and Snake rivers; and the Kamal and Lapwai of Idaho reserve. 5. *Chinuks.*—The Watlala, Sklilût, Kathlamet, Wakiakum, Klatsop, Klakama, Kalapuya, Yamkally, and Killamâk of lower Columbia basin, mostly extinct. Speech radically distinct, but now represented only by the Chinuk jargon.

The names of Nos. 1 and 2 are purely conventional. *Hydah* or *Haida* was originally applied by Francis Poole to the Queen Charlotte tribes, and was afterwards extended to all the members of that family. *Nutka*, from Nutka Sound, west coast of Vancouver Island, came gradually into use as the collective name of the eastern Vancouver tribes, and of some peoples on the opposite mainland ethnically related to them. But the languages differ so widely that they cannot be reduced to a common root. Though possessing great intelligence and even considerable artistic skill, shown especially in their wood and bone carvings and plastic works, these north-western nations betray an absolute incapacity for adapting themselves to civilized institutions. Sproat tells us that many of those who have been settled, under the most favourable circumstances, in different parts of Vancouver, simply die out through inanition, or from sudden change of life.

IV. *Californian Races.*—This is mainly a geographical grouping, but with three large ethnical and linguistic families—the Klamath, Pomo, and Runsien. Many of the others belong to the Shoshone, Athabascan, and Yuma connexions. But the rest form a chaos of tribes, generally of a debased physical and moral type, and speaking rude dialects which baffle all attempts at classification. They are all rapidly disappearing into the "reserves," or off the face of the land. The *Klamath* family, in the Klamath river basin, and thence eastwards to Nevada, comprises the Lutuami or Klamaths proper, the Cahroes and Euroes ("Upper and Lower Roes"), the Modocs, Yacons, Shastas, Weitspeks, Wishosks, Wallies, Yukas, and others stretching south to the Humboldt river. South of them are the *Pomos*, or "People," mainly in the Potter valley, including the Kahto, Choam, Chadela, Kalamet, Shebalne, Lama, Comacho, Socoa, Sanel, and the Gallinomero of the Russian River. Still further south are the *Runsiens* of Monterey Bay, with linguistic affinities stretching all along the coast northwards to San Francisco, and southwards beyond Cape Concepcion to the islands of San Miguel and Sta Cruz. The chief members of the group are the Eslenes, Olhones, Mipacmacs, Yolos, Talluches, Waches, Powells, and others about Lake Tulare. In the Napa valley is a small family including the Ulukas, Suskols, Kalayomanes, Myacomas, and Caymus; and in the Sacramento valley are the Secumne, Kosumne, Yasumne, Ochecumne, Chupumne, and some twenty others, whose tribal names all end in *umne*, and who may perhaps be regarded as forming a distinct linguistic group. But they will have vanished before the point can be settled.[1]

[1] In the eyes of certain ethnologists California has always been a favourite harbour of refuge for distressed Chinese or Japanese junks, whose crews are to be regarded as the founders of the arts, cultures, and empires of the New World. A recent attempt to revive this theory has been made by Lieutenant Wheeler (*Expedition through South California*, 1875), who found some apparently archaic Chinese hieroglyphics cut into the basalt rocks near Benton, South California. These have been published in Petermann's *Mittheilungen* (vol. xxiii. part 4, 1877) by Oscar Loew, who fancies he can decipher the Chinese symbol for *to*, *i.e.*, earth, and thence draws an argument in favour of the wild theory seriously advocated

V. *Shoshone and Pawnee Families.*—These form one ethnical, but apparently two linguistic groups, for L. H. Morgan regards the Pawnee as distinct not only from the Shoshone but from all other languages.

The *Shoshone* or *Snake* family occupies a wide domain, including most of Idaho, Utah, and Wyoming, besides parts of Oregon, Nevada, West Montana, Arizona, North Texas, South California, and New Mexico. There are six distinct groups :—

1. *Wininasht*, or *Western Shoshones*, Oregon and Idaho. 2. *Bannacks*, Oregon, Idaho, Nevada. 3. *Utahs* or *Utes*, with numerous subdivisions (Utes proper, Washoes, Pah-Utes, Gosh-Utes, Pi-Edes, &c.), Colorado, Utah, Nevada, Arizona, and South California. 4. *Comanches* or *Yetans*, three branches (Paducas, Yamparaks, and Tenawas), North Texas, New Mexico, North Mexico. 5. *Moqui*, New Mexico; all the seven Moqui pueblos except the Oreibe (Haro), in which the Tegua language is current. 6. *Diegueño* (Kizh, Kechi, and Netela), about S. Diego, the south-west corner of California; but by Gatschet these are now affiliated to the Yuma stock (*Zeitschr. für Ethnologie*, 1877, p. 365). The *Benemé* and *Cobaji* of south-east California are also included by Gatschet in the Shoshone family.

The *Pawnee* (*Pani*) area is confined to Kansas and Texas, besides the Pawnee reserve, Indian territory, with three main divisions :—

1. *Pawnees proper*, including the Chäuè, Kitkä, Skidi and Petähänerot, Kansas and Pawnee reserve, Indian Territory. 2. *Arikarees* or *Rikarees*, formerly in the Missouri Valley, 47° N. 3. *Wichitas*, upper course of Red and Canadian Rivers, Texas, with whom should be grouped the Kichai, Waccoe, and perhaps the Towiak, Towakoni, Wacho, and Caddo of Texas and Louisiana. To the same connexion probably belonged the extinct Adaize, Nachitoch, Chetimach, Attacapa, and others of Louisiana, figuring in Gallatin's synopsis as stock languages (Schoolcraft, iii. p. 401).

VI. *New Mexican Pueblos.*—This is a strictly ethnical family occupying a compact area in New Mexico, but according to W. C. Lane (Schoolcraft, v. p. 689) speaking six distinct languages sprung of one original stock, as under :—

1. *Queres*, current in the Acoma, Cochitimi, Kiwomi, Laguna, and four other pueblos. 2. *Tegua* or *Taywaugh*, current in the Nambe, Tesugue, San Juan, and three other pueblos, besides the Haro, a Moqui pueblo. 3. *Picori* or *Enaghmagh*, current in the Picori, Isletta, Taos, and five other pueblos. 4. *Jemez*, current in Jemez and Pecos only. 5. *Zuñi*, current in Zuñi only, and said to be a radically distinct language. 6. *Moqui*, a Shoshone dialect (see V. above), current in all the Moqui pueblos except Haro.

One of the most remarkable of existing linguistic phenomena is the number of widely diverging languages spoken in these twenty-six New Mexican pueblos, where the uniformity of institutions, agricultural habits, town life, and social intercourse might be supposed to establish a community of speech.

VII. *Yuma Stock.*—This linguistic and ethnical group in South Arizona and South California is named from the typical Yuma tribe formerly at the junction of the Gila and Colorado rivers. The family has been learnedly treated by A. S. Gatschet (*Zeitsch. f. Ethnologie*, 1877, pp. 341 and 366), who regards the Yuma as fundamentally distinct from all the surrounding forms of speech. The tribes are now mostly gathered in the three reserves of the Colorado river (right bank, 34° N.), San Carlos, Gila river, south-east Arizona, and Pima and Maricopa, South Arizona, with a joint population of 5249, to which must be added about 750 for those who are still independent, making 6000 for the whole race. Chief tribes :—

1. *Yavipai* or *Yampai*, formerly west and north-west of the Aztec Mountains. 2. *Konino* or *Casnino*, San Francisco Mountains; said to be extinct. 3. *Tonto* or *Tonto-Apache*, between the Green River and Aztec Mountains, distinct from the Tonto-Apaches of Athabascan stock. 4. *Maricopa* or *Cocomaricopa*, middle course of the Gila. 5. *Hualapai* or *Wallapai*, between the Colorado and Black Mountains. 6. *Mohave* or *Mojave*, properly *Hamukh-habi* ("Three Hills"), largest of all the Yuma tribes, both sides of the middle and lower Colorado. 7. *Yuma* or *Kutchan*, at junction of Colorado and Gila rivers. 8. *Cocopa* or *Cucapa*, at mouth of the Colorado. 9. *Comoyei* or *Quemeya*, collective name of all the Yuma tribes between the lower Colorado and the Pacific, including (according to Gatschet) the *Diegueños* (see V., No. 6), and the *Kitiwi* near San Tomas mission. 10. *Cochimi*, *Pericui*, and *Guaicuri* of lower California. Probably to the same family belonged the extinct *Cajuenches*, *Cucapas*, *Jalchedums*, *Noches*, *Cawinas*, *Niforas*, and others of South and East Arizona.

VIII. *Athabascan or Tinney Family.*—This is the most widespread ethnical and linguistic group in North America, comprising most of Alaska and the Canadian Dominion from the Eskimo domain to the Churchill river north and south, and from the Rocky Mountains to Hudson Bay west and east, besides isolated enclaves in Oregon, Arizona, New Mexico, Colorado, and North Mexico. The term *Athabascan* is geographical, from Lake Athabasca, a great rallying point of the northern tribes, while *Tinney*, suggested by Petitot, variously pronounced Tinné, Thynné, Déné, Tena, Itynai, Tanai, Dtinné, &c., and meaning "People," is the general tribal name. About the spelling, sound, and identification of the individual tribal names, the greatest confusion prevails. Thus *Kenai*, used by Francis Müller as the collective name of a distinct group, is supposed to be an Innuit word by Dall, who says that it should consequently be applied to no tribes of Tinney race. *Kolchaina* or *Kolshane*, figuring in most tables as a special tribe, appears to be a term vaguely applied by the Russians to all the interior Tinneys of Alaska, about whom they knew little or nothing. The Chippewyans of Lake Athabasca are constantly confused with the Algonquin Chippewas of Upper Canada, just as the Tonto-Apaches of Yuma stock are with the Tonto-Apaches of Athabascan stock. The Alaska division especially was in a chaotic state until Dall (*op. cit.*) surveyed the field anew, and supplied the subjoined corrected and apparently complete list :—

Kaiyuhkhotâna, lower Yukon and Kuskokwim rivers; Koyûkukhotâna and Unâkhotâna, right bank of lower Yukon; Kutchins or "People" (including the Tenan-Kutchin, Tananah river watershed; Tennuth Kutchin and Tatsah Kutchin, between the Yukon rapids and mouth of the Porcupine, extinct; Kutcha-Kutchin, about junction of Yukon and Porcupine; Natsit-Kutchin, from the Porcupine to Romanzoff Mountains; Vunta-Kutchin, from the Porcupine to the Arctic Innuits; Tukkuth-Kutchin, head-waters of the Porcupine; Han-Kutchin, Yukon river above Kotlo river; Tutchone-Kutchin, about White River; Tehânin-Kutchin, Kenai Peninsula; Abbato-Tena, Pelly and MacMillan rivers; Nehaunees, about source of Pelly river; Acheto-Tinneh, head-waters of Liard river; Daho-Tena or Sikannees, Liard river; Tâhko-Tinneh, Lewis river basin; Chilkaht-Tena, Lewis and Lebarge rivers; Ahtena, Atna river basin.

The other members of the Tinney family may be grouped in four geographical divisions as under :—

1. *Mackenzie Basin*: Sawessaw Tinney (Chippewyans), Lake Athabasca; Tantsawhoots of the Coppermine; Beavers, Dog-ribs, Strongbows, Red Knives, Hares, Sheep, Brushwood, and others enumerated by Petitot, whose theories are wild, but whose facts form a substantial contribution to science. 2. *New Caledonia*: the Tahkali or Tacullies, Mackenzie's Nagailers, and the Carriers of the Canadian trappers include the Nascotin, Nathliautin, Chilcotin, Taltotin, and several others. 3. *Oregon*: the Umpquas on the Umpqwa river, the Tlaskanai of the lower Columbia, and the Hoopahs near the north frontier of California. 4. *South-Western States*: the Apaches and Navajos, who roam over the region between Utah and Sonora.[1]

IX. *Algonquin Family.*—This ethnical and linguistic group, next in extent to the Tinneys, but far more important historically and numerically, stretches from the Tinney domain southwards to the latitude of South Carolina, and from the Atlantic to the Rocky Mountains. Most of the tribes on the Atlantic seaboard have either disappeared, migrated westwards, or been collected into the reserves. But many have acquired such celebrity in the stirring records of Indian warfare that the more noted with their original geographical domain will be included in the subjoined list of all the Algonquin races.

1. *Northern Branch*: Chippewas or Ojibways, Upper Canada and Michigan; Ottawas, Ottawa river valley (some now in Manitoulin Island, Lake Huron, others in Indian Territory); Nasquapees, interior of Labrador; Montagnais, south coast of Labrador; Crees or Knisteneaux, between Lakes Winnipeg and Athabasca north and south, and from Rocky Mountains to Hudson's Bay, west and east. 2. *Eastern Branch*: Abenakis, Maine, New Hampshire (later on, Lower Canada); Mikmaks, Nova Scotia, New Brunswick, and Lower Canada; Tarratines, New Brunswick; Etchemins or Milicetes, New Brunswick and Maine; Penobscots, Penobscot river, Maine; Passamaquoddies, East Maine; Amariscoggins, New Hampshire; Mohicans or Mohegans, Connecticut and New York; Naticks, Massachusetts (speech survives in Eliot's Bible); Pequods, Massachusetts, west of Cape Cod; Adirondacks, New York highlands; Manhattans, Manhattan Island, site of present city of New York; Leni-Lennappes or Delawares, Delaware, now in Indian Territory. 3. *Southern Branch*: Powhattans, Virginia and Maryland; Accomacs, Accomac river, East Virginia; Rappahannocks, Rappahannock river, Virginia; Panticoes, North Carolina, southernmost of all the Algonquin tribes; Shawnees, Pennsylvania, Kentucky, and Ohio, now in Indian Territory. 4. *Western Branch*: Illinois, Illinois river basin; Miamis, Great Miami river basin; Pottawattamies, Michigan; Kaskaskias, Kaskaskia river, Illinois, now in Indian Territory; Michigamies, south shore of Lake Michigan, named from them; Sacs or Sawkee and Foxes or Outtagaumi, middle course of Mississippi, now in Indian Territory and Nebraska reserves; Cheyennes, Lake Winnipeg (later on, Missouri and Platte rivers); Arapahoes, upper Arkansas and Platte rivers; Blackfeet, Saskatchewan forks, south to Maria's river; Ahahnelins, Milk river, Montana.

The linguistic affinities of the four last named are somewhat doubtful, but Albert Gallatin shows good grounds for connecting them with the Algonquin group.

X. *Wyandot-Iroquois Family.*—This is a distinct and historically famous group, allied ethnically to the Algonquins, and linguistically, Morgan thinks, remotely to the Dakotas. Their area is Upper Canada, about the great lakes, New York, and the Virginian highlands; they nowhere reach the Atlantic coast, and are everywhere surrounded by tribes of Algonquin stock. There are three main divisions :—

1. *Wyandots* or *Hurons*, including the Eries or Erigas, Ahrendahronons, and Attiwandoronk or "Neutral Nation," Canada. 2. *Iroquois*, or "Six Nations," chiefly in New York, a famous political confederacy collectively known as the *Ongwehonwe*, or "Superior Men," and comprising the Mohawks, Oneidas, Onondagas, Senecas, and Cayugas, besides the Tuscaroras, who joined the league from North Carolina in 1712. 3. *Monacans* or *Monahoacs* of Virginia, including the Nottoways, Meherries (Tutelos), and others, who later on joined the Iroquois confederacy.

XI. *Dakota or Sioux Family.*—This is an independent and widespread ethnical and linguistic group, whose proper domain is the western prairies between the Mississippi and Rocky Mountains east and west, and stretching from the Saskatchewan southwards to the Red River of Texas. The chief divisions are :—

1. *Dakotas proper*, of the Missouri basin. This term means "Allies," and includes the Isauntles, Yantons, Teetons, and Sissetons, each with several subdivisions. 2. *Assiniboines* or *Stone Indians*, known to the Dakotas as "Hoha," or "Rebels," because they withdrew from the confederacy about 1600, and settled in the Assiniboine river basin. 3. *Winnebagoes* ("Puans" of the Canadians),

in Charles Leland's *Fusang; or the Discovery of America by Chinese Buddhist Priests in the Fifth Century*. He also compares words from various Californian idioms with Japanese and Chinese, forgetting that these two languages themselves belong to two entirely different orders of speech, and have nothing in common beyond coincidences and borrowings.

[1] *Apache*, *i.e.*, "the men" (root *apa*, man), is a Yuma word, applied to the southern Tinneys, whose true name is *Sis Inday*, or "men of the woods." From the ending *che*, an attempt has been made by certain etymologists to connect these people with the Puelche, Huilliche, and other Patagono-Chilian tribes whose names end in the same syllable. But here *che* is the Araucanian "man," whereas in Yuma *che* is the definite article suffixed. Of the Apaches the chief tribes are the Coyoteros, Tontos, Lipans, Mescaleros, Pinaleños, Llaneros, and Gileños, so named by the Spaniards; the real tribal names are undetermined.

parent stock of the Omahas, Iowas, Kansas, Quappas or Arkansas, and Osages of the middle and lower Missouri basin. 4. *Upsarokas* or *Crows*, of the Yellowstone valley. 5. *Minnetarees, Hidatsa*, and *Mandans*, of the upper Missouri, of doubtful linguistic affinities, but by Morgan regarded as intermediate between the Dakotas and Appalachians. W. W. Matthews also affiliates the Hidatsa language to the Dakota family.

XII. *Appalachian Races.*—These form an ethnical and geographical grouping, including four distinct languages, which, however, according to Morgan, are remotely related to the Dakota; area, the south-east corner of the United States, westwards to Arkansas and Louisiana, northwards to Tennessee and South Carolina, all inclusive; name purely conventional, from the Appalachian or southern spurs of the Alleghanies. Here was a large linguistic family forming a powerful confederacy, of which the *Muscogees* or *Creeks* of Alabama were the centre. The other members were the *Seminoles* of South Alabama and Florida; the *Chickasaws* of Mississippi; the *Mobiles* of Florida West; the *Choctaws* of the lower Mississippi; the *Colusas* or *Coosadas, Alibamous, Appalaches, Uches*, and *Timucuas* (?) of South Carolina and Georgia. Of distinct speech were the *Natchez* of the lower Mississippi, who were said to have spoken three languages; the *Cherokees* or *Chelekees*, of the Appalachian slopes, and the *Catawbas* of South Carolina, supposed by some to be the Eries, or the neutral nation who disappeared from the lake region about 1656. All these races are either extinct, or have been removed to the reserves of Indian Territory, where two of the stock languages (Cherokee and Creek) are still current. Natchez and Catawba are extinct. Special interest attaches to the extinct Timucua language, formerly current along the east coast of Georgia and Florida southwards to and beyond Cape Cañaveral. It is a highly synthetic form of speech, regarded by Gatschet ("Volk und Sprache der Timucua," in *Zeitsch. f. Ethnologie*, 1877, p. 245) as a stock language, and possessing in the grammar, dictionary, and catechisms of Pareja, published in 1612–13 in Mexico, the oldest written records of any native tongue east of the Rocky Mountains. Gatschet gives a full account of its structure, which philologists will find extremely interesting.

XIII. *Mexican Races.*—This is a geographical grouping, the region comprising an exceptional number of radically distinct languages, and apparently three or four ethnical types. There is one large and important linguistic family, the Aztec-Sonora, which stretches southwards to Nicaragua, and for which Buschmann has sought affinities as far north as the Shoshone group. Its chief members are:—

1. *Aztec* or *Mexican proper*, widely diffused throughout the Nahua empire, overthrown by Cortez. 2. *Cora*, in the state Jalisco. 3. *Tarahumara*, in Chihuahua and Sonora. 4. *Cahita*, in Sinaloa and Sonora. 5. *Niquiran*, of Nicaragua. 6. *Tlascaltec*, of San Salvador. With these are probably related the *Pima* and *Opata* of Sonora and Sinaloa, the *Acaxee* of Durango, and the *Tubar* of Chihuahua.

The other chief stock or at least not yet classified Mexican tongues are the *Miztec* and *Zapotec* of Oajaca, *Tarasco* current in the old kingdom of Michoacan, *Matlalzinca* north of Anahuac, *Ceres* and *Cochita* of Sonora, *Tepecano* of Jalisco, *Zacatec* of Zacatecas, *Tamulipec* of Tamaulipas, and *Otomi*, an interesting form of speech still almost in the monosyllabic state, current in the mountains enclosing the Anahuac table-land. This is the more remarkable that most of the other Mexican languages are highly polysynthetic; but the attempt made to connect Otomi with Chinese has merely served to place their fundamental difference in a clearer light.

XIV. *Central American Races.*—Like the foregoing, this is a geographical grouping, with one wide-spread linguistic and ethnical family, the *Maya-Quiché* of Yucatan and Guatemala with an outlying branch in Vera Cruz and Tamaulipas. Of this family the chief members are the *Maya*, still generally current in Yucatan; *Zendal* and *Zotzil* of Chiapas; *Mam* and *Pokomam* of Vera Paz, Guatemala; *Huastec* of Vera Cruz and Tamaulipas; *Totonac* of Vera Cruz; *Quiché, Chol*, and *Zutugil* of Guatemala. The Mayas, like the Aztecs, possessed a writing system, of which three documents still survive,—the Dresden Codex, published in Lord Kingsborough's collection as an Aztec MS., the Mexican MS., No. 2 of the Paris National Library, and the Troano MS. in Madrid. Bishop Landa even credited them with the invention of an alphabet; but all attempts to interpret these documents by the key left by him have hitherto failed.

In Nicaragua and Honduras, besides the Aztec Niquiran, Squier (*Nicaragua*, ii. p. 308) reckons three distinct linguistic groups:—

1. *Melchora*, including the Wâlwa, Rama, Toaca, Poya, and Waikna or Mosco (Mosquito), collectively known as Bravos, probably of Carib stock, but with a mixture of Negro blood. 2. *Chorontega*, including the Dirian, between Lake Nicaragua and the Pacific; Nagrandan, north of the Dirian; Orotinan, about the Gulf of Nicoya. 3. *Chondal*, Chondales highlands, north and east side of Lake Nicaragua.

In Costa Rica and the peninsula of Panama there are a multiplicity of unclassified tribes, amongst whom are current at least five stock languages:—

(1) *Doracho* of Veraguas; (2) *Savaneric*; (3) *Bayano*, Rio Chapo, Pacific coast; (4) *Manzanillo* (San Blas), Atlantic coast, Costa Rica; (5) *Bribri*, a Costa Rica dialect, has been compared, but on slender grounds, with some West African tongues.

XV. *New Granada and Guiana Races.*—The confusion of tribes is continued southwards into the Colombian and Venezuelan Cordilleras; but, as we proceed eastwards along the Orinoco plains and through the Guianas, greater order seems to prevail. In New Granada itself there is at least one marked ethnical and linguistic group, the *Chibcha* or *Muisca* of Bogota, a civilized people, noted for their remarkable taste and skill in the execution of gold ornaments. Some of these works recently discovered and exhibited by Mr Powles at a meeting of the Anthropological Institute, London, excited universal surprise and admiration. This little known but extremely interesting people formed an important link in the chain of civilized and agricultural nations stretching along the western uplands from the New Mexican Pueblos, through the Aztecs of Mexico, Mayas of Yucatan, Dorachos of Veraguas, Chibchas of Bogota, and Peruvian Quichuas, to the Aymaras of Bolivia. Elsewhere in New Granada the tribes are almost past counting. In the southern province of Popayan alone ninety-four distinct languages were reckoned at the time of the conquest; and, although most of these are extinct, the unclassified races both here and in the north are still very numerous. The only large linguistic group is that of the *Salivi*, including the Betois, Eles, Yaruras, Atures (extinct), Quaquas, Macos, and others about the western head-streams of the Orinoco and in the Popayan highlands. Further east is the *Barré* family, including the Maypuri, Baniwa, Achegua, and many others in Venezuela and Guiana, besides some tribes as far south as Moxos in Bolivia. From the recent ethnological researches of Everard F. im Thurn (*British Guiana Museum*, Georgetown, 1878), there appear to be at least four independent linguistic groups in the Guianas:—*Warau* and *Arawack* in the coast region, *Wapiana* or *Wapisana*, with *Atorais*, in the savannah region, and *Carib* everywhere. At the time of the discovery the Caribs represented the conquering element in the West Indies, whence they have since disappeared, unless a few survive in Dominica (Vivien de Saint Martin). But they are still numerous, either pure or mixed with Negroes and others, from Honduras round the coast to the Amazon delta. They are represented in French Guiana chiefly by the *Galibi, Oyapok, Emerillon, Nuragwe*, and *Rucuyennes*, the last-mentioned on both sides of the Tumac-Humac range (Dr J. Crevaux in *Tour du Monde*, June 28, 1879). In British Guiana the Carib tribes are the *Ackawais* and *Caribisi* of the coast and forest regions, the *Arecumas* and *Macusis* of the savannah region. On the upper Orinoco are the *Carinas* or *Calinas*; in Dutch Guiana the *Kirikiricots, Acuria, Saramacca, Aukan*, and *Mataaric*; in Brazilian Guiana the *Pianghottos, Parechi, Daurais* (extinct ?), *Mandaucas, Masacas*; in Venezuela the *Tiverigotes, Guaraunos, Guayanos, Tamanacs, Avarigotes, Acherigotes, Piritus, Palencas, Chacopatas*, and many others. On the affinities of the Carib race great uncertainty prevails, some regarding them as an independent stock, some tracing them across the islands to the Allighewis or Alleghans, who are supposed to have been driven by the Algonquins from the Mississippi regions in the 10th century, while others, with D'Orbigny (*L'homme Americain*, vol. ii.), affiliate them with some show of probability to the Guaranis of Brazil.

XVI. *Peruvian and Bolivian Races.*—Here the grouping is strictly ethnical and linguistic in the Cordilleras and upland plateaus, which are mainly occupied by one great historical and civilized race, with two well-defined branches—*Quichua* of Peru and *Aymara* of Bolivia. Under the Incas Quichua, one of the most highly cultivated but also one of the harshest of American tongues, was current along both sides of the Cordilleras, from Quito on the equator southwards to the Araucanian domain about 30° S., but interrupted between 13° and 20° S. by the Aymara, which, like the northern Quiteño, seems to be an older and ruder form of the common stock language. Still more primitive forms were probably the extinct *Cara* and *Puruha* of Ecuador. But in this northern province, which was the last added to the empire (under the twelfth Inca Huaina-capac), there were said to be at the conquest forty other nations, speaking as many distinct languages, with three hundred different dialects. Of these a considerable number still people the banks of the Yapura, Putumayo, Pastassa, Napo, and other northwestern head-streams of the Amazons, the most noteworthy being the *Jivaros* of the Pastassa, the *Zapáros* of the upper Napo, the *Anguteras* and *Orejones* of the lower Napo, the *Colorados* and *Capayas* of the uplands east of Quito, and the *Copanes* of the upper Aguarico. The secret language of the Incas was apparently the Aymara of Lake Titicaca, the cradle of their race; and remotely connected with the same branch are probably the Olipe or Atacameño, between 19° and 22° S., and the Chango, between 22° and 24° S., although R. A. Philippi (*Reise durch die Wüste Atacama*, Halle, 1860) regards this latter as fundamentally distinct both from the Quichua and the Aymara.

Antisuyo, the eastern division of the old empire, stretching along the eastern slopes of the Peruvian and Bolivian Andes between 10° and 19° S., is occupied by five nations, the *Yuracares, Moceténes, Tacanas, Maropas*, and *Apolistas*, whom D'Orbigny (*op. cit.*, vol. i.) collectively calls *Antisians*, affiliating them to the Quichua-Aymara family, from which, however, they differ in speech and physique as profoundly as they do from each other. Hence the so-called *Antis* or *Antisians* of more recent anthropological works have no ethnical or linguistic unity, and, like *Chinchasuyo, Candisuyo*, and

Collasuyo, i.e., northern, western, and southern province, the term *Antisuyo* itself is purely geographical.

As we descend to the Bolivian lowlands, the confusion of races reaches its climax in the provinces of Moxos, Chiquitos, and Gran Chaco. Notwithstanding the disappearance of many tribes in recent years, E. D. Matthews (*Up the Amazon and Madeira*, 1879) still found in the Beni Missions, Moxos, besides the above-mentioned Maropas, six distinct tribes—*Cayubabas, Mobimas, Mojeños, Canichanas, Itonamas*, and *Baures*—"each having a language of its own." But the Baures would seem to be a branch of the Mojeños, who are again affiliated to the Maypuri of the Barre family (see XV.). Other nations in Moxos with distinct speech are the *Chapacuras* in the south-east, and the *Pacaguaras* and *Itenes* in the north.

Chiquitos is occupied by eleven distinct nations, all speaking radically different languages, but presenting a uniform physical type:—*Chiquitos* in the centre; *Samucus, Curaves, Tapiis*, and *Corabecas* originally in the south-east; *Saravecas, Otukes, Curuminacas, Covarecas, Curucanecas*, in the north-east; and *Paiconecas* in the north-west. The language of the Chiquitos, of whom there are endless subdivisions, is one of the richest and most widely diffused in South America, serving, like the Tupi in the east, as a sort of lingua franca in the Bolivian lowlands and the northern parts of Gran Chaco. The numerous tribes of this latter region seem to form an ethnical group related to the Chiquitos peoples, and like them speaking a great variety of distinct languages. The greatest confusion still prevails as to their mutual relations; but the main linguistic groups seem to be the *Mocobi-Toba* of the Salado and Vermejo rivers; the *Mataguaya*, including the *Vilelu, Lule*, and *Chanes* between the Pilcomayo and Vermejo; the *Abipone*, on the right bank of the Parana, between 28°–30° S.; and the so-called *Lengua* (properly *Juiaje*) in the centre of Gran Chaco, surrounded by Mocobi tribes. Here were also the extinct *Guaycurus* (probably akin to the Tobas), noted for their skill in horsemanship. Hence the term Guaycuru came to be applied generally to all the mounted Indians of Gran Chaco, and, though no longer the name of any particular tribe, it continues to figure in ethnographic works as a racial designation, increasing the confusion in a region already overburdened with obsolete or erroneous ethnical nomenclature.

XVII. *Brazilian Races.*—Here the grouping, with one great exception, is still mainly geographical. The exception is the widespread *Tupi-Guarani* ethnical and linguistic family, rivalling in extent the Athabascan and Algonquin of the northern continent, and including, besides a great part of Brazil, all Paraguay, about half of Uruguay, large enclaves in Bolivia, and, if the Carib is to be regarded as a branch, nearly all the Guianas and Venezuela. Of this race the two main divisions are the *Guarani*, from about the neighbourhood of Monte Video to Goyaz south and north, and stretching west and east from the Paraguay to the Atlantic, and the *Tupi* thence northwards to the Amazon and Rio Negro. The southern division may be regarded as nearly compact, but the northern everywhere encloses a number of races apparently of different stocks, while along the Amazon and its great tributaries the tribes are as numerous as they are diverse in speech and often in physique. Over 15 distinct peoples are mentioned on the Xinga river alone, 20 on the Tapajoz, as many on the Ucayali, 50 on the Japura. R. S. Clough (*The Amazons*, 1872) gives lists of 33 on the Purus, and of 37 on the Naupes, a tributary of the Rio Negro; over 100 different dialects are current on the Rio Negro itself (Martius), and as many as 234 tribal names occur in Milliet de Saint-Adolphe's *Diccionario Geographico do Imperio de Brazil* (Paris, 1863). Here the only means of communication is afforded by the *Lingoa Geral*, or "general language," which is based on the Tupi, and which has gradually become current throughout the empire.

Of the Guarani-Tupi stock the most representative races are the *Tupinambas*, formerly dominant on the coast of Para; the *Tupiniquins* of Espirito Santo; the *Petiguares* of the Paraiba; the *Tupuias* of Bahia; the *Tobajares* of Maranhão; the *Caetes* of Ceara; the *Obacatuaras* of the Rio S. Francisco; the *Mundrucus, Apiacas*, and *Mauhés* of the Tapajos; the *Tappés, Patos*, and *Minuanos* of Rio Grande do Sul; the *Piturunas* of the river Curitiba; the *Guanhanaris* of the Parana; the *Guarayos* and *Chiriguanos* of the upper Memoré, Bolivia; the *Omaguas* of the Yapura; the *Manaos, Juris, Tereccumas, Caripunas*, and nine others in the Rio Negro basin.

The Non-Guarani element in Brazil, often collectively known to the Tupis as *Tapuyas, i.e.*, "strangers" or "enemies," has hitherto baffled all attempts at classification. The best known groups, mostly linguistic, are the *Aimore* or *Botocudo* of the Aimore coast range; the *Pamacan*, widely diffused in Bahia and Minas-Geraes; the *Curys*, with many subdivisions in Rio Janeiro, Espirito Santo, and Minas-Geraes; the *Canecran*, with five branches in Para and Goyaz; the *Cairiri* or *Kiriri*, a large nation in the Borborema mountains, with two branches (*Velhos* and *Novos*) in Pernambuco, Parahiba, and Ceara, grouped by Martins with the Moxos of Bolivia, the Cunamares of the Jurua, the Majurunas of the Javary, the Manaos of the Rio Negro, and many others under the collective name of *Guck* or *Coco*; the *Gè* with diverse prefixes (Au-Gè, Canacata-Gè, Cran-Gè, Payco-Gè, Pontaca-Gè, &c.) in Maranhão and Para, with whom must be grouped the Timbiras of Goyaz ("fallavão o idioma dos Gamelleiros ou Timbiras," M. de Saint-Adolphe, i. p. 384); the *Vouré* of Matto Grosso, now united with the *Choco, Pipian*, and *Uman*, all of like speech; the *Carijos*, formerly very powerful in province São Paulo, now mostly fused with others; the *Carajas* and *Chambioas* of rivers Araguaya and lower Tocantins, Goyaz, and Para; the *Goya*, very numerous in Goyaz, to which province they give their name; the *Charruas*, formerly very powerful in the extreme south and in Uruguay, grouped by D'Orbigny with the Pampas Indians, and described by him as "peut-être la nation Americaine que l'intensité de la couleur rapproche le plus du noir" (ii. p. 85); the *Bororos*, formerly dominant over a vast region in Matto Grosso.

XVIII. *Austral Races.*—These occupy four geographical areas, to which correspond four distinct ethnical and linguistic groups:—

1. *Auca* or *Araucanian*, Chilian and Patagonian Cordilleras; type very uniform, and by D'Orbigny affiliated to the Peruvian; speech entirely distinct from all others, and spoken with little dialectic variety throughout the whole area. The numerous branches are generally indicated by a geographical terminology, as *Picunche*, "northern people," *Puelche*, "eastern people," *Huilliche*, "southern people," &c., the final syllable *che* signifying "people." But the official Chilian divisions are:—(*a*) *Motuche*, or *Arribanos, i.e.*, "highlanders," and *Abajinos* or "lowlanders," between rivers Malleco and Cautin; (*b*) *Larquenche* or *Costinos, i.e.*, "coast people," between rivers Lebu and Imperial; (*c*) *Huilliche*, or "southerners," in two divisions, south of rivers Cautin and Tolten. Total population, 24,360 unmixed Araucanians (Edouard Sève, *Le Chili tel qu'il est*, Valparaiso, 1876).

2. *Puelche*, occupying the Pampas region from the Saladillo to the Rio Negro; hence known to the Spaniards as the *Pampas* Indians. *Puelche* or eastern people is their Araucanian name, answering to the Patagonian *Yonec* and *Penck*. There is great uniformity of type and speech, the latter, like Araucanian, being distinct from all others. No well-recognized tribal divisions exist. The race is dying out or becoming absorbed in the general mass of the Argentine population.

3. *Patagonian*, the *Tehuelche, Chuelche*, or *Huilliche* (*i.e.*, "southerners") of the Araucanians; national name *Tsoneca*; area, Patagonia from the Rio Negro to Magellan Strait, and from the Cordilleras to the Atlantic. This is the tallest race on the globe, with mean height 5 feet 11 inches (Topinard, *Anthropology*, p. 320), and otherwise differing widely from all the American types, with which they have nothing in common except the structure of the hair and the polysynthetic form of their speech. The present race again seems distinct from the prehistoric in this region as represented by the skulls recently found by Moreno at El Carmen on the Rio Negro. These are highly dolichocephalous, whilst Dr A. Weissbach (*Zeitschr. für Ethnologie*, 1877, p. 8) represents the modern Tehuelches as amongst the most brachycephalous on the globe, approaching in this respect nearest to the chimpanzee type.

4. *Fuegians*, the *Pescherais* of some writers, Tierra del Fuego; no recognized collective national or tribal names; one ethnical type, entirely different from the Patagonian, and by D'Orbigny allied to the Araucanian; two apparently distinct languages, a northern and a southern variety, with no known affinities to any on the mainland or elsewhere. They probably occupy the lowest scale of culture in the American division of mankind,—in this respect corresponding to the Negritos and Bushmen of the eastern hemisphere.

Modern History and Present Distribution of North American Indians.

It is only very recently that the number of Indians on the North American continent has come to be known with any degree of accuracy. The best estimates at present accessible, based on the reports of Indian agents and on the United States census for 1880, give the total number in the United States as 303,248. The number in British North America is estimated, more roughly, at 103,969, making a total for the continent, north of Mexico, of 407,217. The following table, which is compiled from the census returns for 1880, and from the reports for 1879 of the superintendents of Indian affairs for the United States and for the British Possessions, may be relied on as approximately correct:—

British Possessions.		Kansas	693
Ontario	15,941	Louisiana	807
Quebec	12,054	Maine	603
Nova Scotia	2,126	Massachusetts	341
New Brunswick	1,433	Michigan	17,045
Prince Edward's Island	266	Minnesota	17,893
Manitoba & N. W. Territory	30,227	Mississippi	1,811
Athabasca	2,398	Montana	20,825
British Columbia	35,154	Nebraska	4,494
Rupert's Land	4,370	Nevada	7,728
		New Mexico	22,860
Total	103,969	New York	5,820
		North Carolina	1,152
United States.		Oregon	5,854
Alabama	170	Pennsylvania	156
Arizona	24,753	South Carolina	113
Arkansas	144	Tennessee	238
California	16,581	Texas	869
Colorado	4,316	Utah	1,166
Connecticut	230	Washington	16,786
Dakota	31,707	Wisconsin	10,340
Idaho	6,248	Wyoming	2,272
Illinois	104		
Indiana	186	Total	303,248
Indian Territory	78,142		
Iowa	801	Grand total in N. America	407,217

The popular idea has always been that these races are fast disappearing, and that their total extinction is merely a question of time. This conclusion has recently been called in question by Colonel Garrick Mallory, of the United States army, in a paper read before the American Association for the Advancement of Science. From the evidence he presents it appears that, while many tribes have decreased in number, and some have even become extinct, others have increased very decidedly, leading to the probable conclusion that the Indian population of North America as a whole has not decreased greatly since the earliest occupation of the country by Europeans. It is at least certain that the Indians have been brought under various influences which tend to prolong and preserve life. The murderous inter-tribal wars have ceased; the people are now better housed, clothed, and fed; many of them have regular avocations; and they have medical attendance when sick.

The general policy of the United States Government, in its management of the Indian tribes within its borders, has been to treat with them as separate but subject principalities. It thus makes treaties with the different tribes, purchases land from them, &c. Its policy further is to place all the tribes upon reservations, whence they are prohibited from wandering, and which are forbidden ground to whites, thus isolating them from the rest of mankind. In return for land ceded by them to the United States most of the tribes receive yearly grants, which are paid in the form of supplies of food, clothing, arms, and ammunition. Under such conditions, the experiment of civilizing them is being attempted,—in the case of some tribes with success, in others, thus far, with utter failure. As, however, all stimulus to self support is wanting, it seems surprising that any tribe should have made perceptible advance at all, and the progress attained is therefore encouraging for future effort. The policy of the Dominion Government is almost precisely similar to that of the United States, but the results are very different in the two countries. While the United States have had almost continual trouble with their aboriginal inhabitants, Canada has had no Indian difficulties of importance. This is due in part to a difference in the practical working out of the policy, but more to differences in environment. The Indian service of the Dominion Government is composed of a trained body of men, who remain in it through life, who thoroughly understand the Indian character, and who become known and trusted by their charges. The members of the United States Indian service, on the other hand, are appointed by political or church influence, and are in many cases unfit for the work; they are changed also as the balance of political power passes from one party to another. The Dominion has always fulfilled the conditions of its treaties, and has always administered punishment promptly and severely when the necessity arose. The United States have broken treaty after treaty, or have neglected to fulfil their obligations to such an extent that most tribes no longer have confidence in the promises of the Government. In cases of outrages by Indians, it has, as a rule, been very slow and dilatory in punishment.

But undoubtedly the principal reason for the immunity the British Possessions have hitherto enjoyed from Indian wars lies in the fact that the Indians have not yet been crowded by the whites. While the area is larger than that of the United States, the Indian population is but about two-fifths as great, and the whites are but one-tenth. The Indians still hold their favourite hunting and fishing grounds; the game and fish have not yet sensibly decreased; and the whites do not yet so press upon them as to arouse their jealousy and suspicion. The history of the Indian tribes in the United States, from the time of the first occupation of the country by the whites, has been one of forced migrations, always westward, to make way for the repeated encroachments of civilization. As the result of a succession of disastrous wars and forced treaties, nearly all the aboriginal population formerly living east of the Mississippi has either been destroyed or removed beyond that river. In the British Possessions they have been more fortunate. The first settlements in the provinces were made by the French, who associated freely with the natives, intermarrying to a large extent. This produced a bond of union between them, the effects of which, in both peoples, are to be seen to the present day. The country being still but thinly peopled, the necessity for removing the Indians, in large numbers, has not yet arisen; and their treatment by the Dominion Government has been more humane and just than in the United States. In consequence of all this, most of them remain in or near their original homes. Excepting those tribes which have moved across the border from the United States, few, if any, have engaged in war against the whites. As long as the western country was the domain of the Hudson's Bay Company the interests of the traders were, to a large extent, identical with those of the natives. The Company furnished a ready market for furs and pelts, of which the Indians were quick to avail themselves; indeed, although it supported a large number of French trappers, by far its principal business was done with the natives.

Indians in the Dominion of Canada.—The general distribution of the tribes of the British Possessions is as follows. In the province of Ontario are found parts of the Six Nations, Wyandots, Chippewas, Minsees, Mississauguas, and others of Algonquin stock. In the province of Quebec are another part of the famous Six Nations, besides Abenakis, Montagnais, Milicetes, Micmacs, and other smaller tribes. In Nova Scotia and Prince Edward's Island are Micmacs, in New Brunswick a part of the same tribe and a few of the Milicetes. In Manitoba and North-West Territory, the Chippewas, Crees, Blackfeet, and Dakotas make up the aboriginal population. The Athabasca district is peopled by the Crees, Assiniboines, Chippewyans, and Beavers; while British Columbia and Rupert's Land contain a great number of small tribes, too numerous to be mentioned here.

Indians of the United States.—Of the numerous and powerful tribes which inhabited New England at the time of its first settlement, but few fragments remain.

A remnant of the once powerful *Penobscot* tribe is settled at Oldtown on the Penobscot river, in Maine, and in other parts of that State and in Massachusetts, and fragments of other tribes still exist.

The *Pequod* and *Mohegan* tribes were amongst the largest and most powerful. Their range was central Massachusetts and Connecticut. During the settlement of those States, these Indians were removed to western New York, where they rapidly became civilized and prosperous. But in 1857, their land being wanted, they were removed to Wisconsin, and placed on a poor reservation there. They now number barely one hundred men, women, and children.

The *Delawares*, when first discovered by the whites, were living on the banks of the Delaware river. Early in the 17th century the Dutch commenced trading with them, under friendly relations. Subsequently William Penn bought large tracts of land from them, moving the Indians inland. A war followed this purchase, the Delawares alleging they had been defrauded, but, with the assistance of the Six Nations, the whites forced them back west of the Alleghanies. In 1789 they were placed on a reservation in Ohio, and subsequently, in 1818, were moved to Missouri. Various removals followed, until, in 1866, they accepted lands in severalty, in the Indian Territory, and gave up the tribal relation. They are now living in civilized fashion, and have become useful and prosperous citizens. Their number is now between 1000 and 1100.

Iroquois, or *Six Nations*.—This powerful and celebrated confederation was composed originally of five tribes known as Mohawks, Oneidas, Onondagas, Senecas, and Cayugas. Later, the Tuscaroras were admitted into the league, which was then called the "Six Nations." At that time their total number was estimated at 11,650, including 2150 warriors. They were unquestionably the most powerful confederation of Indians on the continent. Their home was the central and western parts of New York State. In the war of the American Revolution they fought on the side of the English, and in the repeated battles their power was nearly destroyed. They are now scattered about on various reservations in New York State, Indian Territory, Wisconsin, and Canada. In 1870 they numbered altogether 13,669, having increased decidedly since the close of the Revolution.

The *Wyandots* or *Hurons* were an Iroquois tribe which lived originally on the shore of Lake Huron. They served as a shuttlecock between the Six Nations and the Sioux, being driven alternately east and west by them, until the end of the last century. In 1832 they removed to a reservation in Kansas. In 1855 many became citizens, while the small remaining fragment of this once powerful tribe removed to Indian Territory.

Chippewas or *Ojibways*.—This tribe, of the Algonquin family, formerly ranged over most of Michigan, Wisconsin, and Minnesota. They were constantly at war with the Dakotas and with their other neighbours. They sided with the English in the Revolution and in the war of 1812. At present the tribe is divided upon thirteen reservations in the above States, and is making gratifying progress in civilization. Their number is now above 20,000.

The *Menominees*, on the Menominee river, in Wisconsin, have never been moved from their original habitat. They served with the French in the war against the Foxes in 1712, and against the English up to 1763. During the Revolution and the war of 1812 they sided with the English. They are now living in a civilized manner, and are engaged very largely in lumbering. Their number is now about 1445, and is said to be diminishing rapidly.

The *Miamis* were first found in eastern Wisconsin, and were estimated at 8000 in number. They were a warlike race, continually engaged in broils with their neighbours, the Iroquois, Sioux, and French, in which they lost heavily. In the Revolution and the war of 1812, like most of the Indian tribes, they sided with the English. After the latter war they fought among themselves, reducing their numbers greatly. The tribe has now almost entirely disappeared, a few families only remaining, scattered over Indian Territory and Kansas.

The *Ottawas* lived originally on the northern shore of the upper peninsula of Michigan. In 1650 they were driven by the Iroquois beyond the Mississippi, only to be forced back by the Dakotas. Then they settled at Mackinaw, and joined the French in their operations against the English. During the Revolution they sided with the English. Most of them were finally moved to the Indian Territory, where they now are, reduced to a mere handful.

The *Pottawattamies* occupied a part of the lower peninsula of Michigan, whence they were driven into Wisconsin by the more powerful Iroquois. They were allied with the French in their wars against the Iroquois, and took part in Pontiac's conspiracy. In the wars between the colonists and the mother country they took the part of the latter. In 1838 most of them were removed to a reservation in Kansas. Of these the larger proportion have abandoned the tribal relation, and become citizens. Of the others, some are in Kansas, upwards of 300 are in Indian Territory, while the remainder are wanderers.

The *Seminoles* are a tribe of the Muskogee family; they originally inhabited the peninsula of Florida. About 1842, after a very disastrous war with the whites, lasting seven years, nearly all of them were removed to the Indian Territory, where they are now settled, are civilized, and are succeeding in the cultivation of the soil. They number about 2500.

The *Creeks* or *Muskogees* formed the most powerful tribe of the Muskogee family; they originally occupied a large part of Georgia, Alabama, and Florida. During the Revolution they fought against the colonists. A few years later they broke out again, but received a severe chastisement. Subsequently nearly all of them were removed to the Indian Territory, where they have made great progress in civilization and material prosperity. During the late civil war they were divided, part adhering to the Union and part joining the Confederacy. At present they number about 14,000.

The *Dakota* or *Sioux* nation is at present the most powerful of the Indian tribes in North America. Its warriors possess fine physique, great personal courage, and great skill in warfare. Though backward in adopting civilization, their intellectual powers contrast very favourably with those of most other tribes. The nation numbers 30,000 to 35,000 souls, divided into twenty-one bands or subtribes more or less independent of one another. At present they range over most of the unsettled portion of Dakota, eastern Montana, and north-eastern Wyoming, their reservations amounting altogether to 108,450 square miles. Until within a very recent period most of the bands of this tribe have resisted all efforts for civilizing them. At present, however, several of the bands are settling down to agricultural labour. Their history has, from the first, been one of war, their name a terror to their Indian neighbours as well as to the whites. Originally their range extended as far east as the State of Wisconsin, and thence west to the Rocky Mountains, its present limit. On the east they encountered the Chippewas, who at that time formed a powerful tribe, fully able to cope with them. By them the Sioux were driven back into Minnesota, after long continued warfare. In 1862 the bands inhabiting Minnesota fell upon the white settlers, and a terrible massacre ensued. The result of this was the removal of these bands from the State to Dakota, where they were placed upon reservations. The bands inhabiting the country farther west have been to a greater or less extent almost continually at war with the whites until 1877; and for many years the protection of the border settlements required the constant presence of large bodies of troops. In 1875 and 1876 the chief, Sitting Bull, at the head of a large body of warriors, maintained a successful resistance against all the troops which could be brought against him, and finally escaped across the boundary line into the British Possessions, with the bulk of his followers.

The *Arapahoes* originally ranged over the central portion of the plains between the Platte and Arkansas. This is a brave, warlike, predatory tribe. With the Sioux and Cheyennes, with whom they have ever been on terms of friendship, they have waged unremitting warfare upon the Utes. From time to time, also, the border settlements have received hostile attentions from them. The southern bands of the tribe have a large reservation in the western part of Indian Territory, while the northern bands have been placed on the reservation of the Shoshones in western Wyoming.

The *Cheyennes* are a tribe of the Algonquin family, which originally lived on the Cheyenne river, a branch of the Red River of the North, in Dakota. Driven westward by the Dakotas, they were found by early explorers at the eastern base of the Black Hills, in Dakota. Subsequently part of them moved south, and allied themselves with the Arapahoes. Within a few years they have all been collected on a reservation in the western part of the Indian Territory. Their whole history has been a series of wars against their red neighbours and the whites. They are a large, powerful, athletic race, mentally superior to most of the other tribes. Their occupations are war and hunting. Thus far they have made little or no progress in civilization. They number about 3600.

The *Arikarees, Gros Ventres*, and *Mandans* are three tribes which inhabit a permanent village at Fort Berthold, Dakota, on the Missouri. They have a partial civilization of their own, not acquired from intercourse with whites. They live in houses made of wood, covered and thatched with earth and straw. For sustenance they depend largely upon the produce of agricultural labour. Their total number is probably about 2000, the Arikarees being the largest tribe, and the Mandans the smallest. The Arikarees, Arikaras, or Rees, as the name is variously rendered, originally lived in the Platte valley, in Nebraska, with the Pawnees, to whom they are related. Within the present century they have made their way northward to their present location. The Mandans were first found living on the Missouri, at the mouth of Heart river, while the Gros Ventres, or Minnetarees, occupied three small villages at the mouth of Knife river. These three tribes were decimated by the small-pox in 1837, shortly after which event they joined together in one village at their present location.

The *Sacs* and *Foxes*, now one tribe, located in Indian Territory, were originally separate, living near Green Bay, Wisconsin. Driven on before the westward march of civilization, they moved first to Iowa, then to Missouri, and finally to their present location. A few still remain in Iowa, Nebraska, and Kansas.

The *Shawnees* or *Shawanoes*, supposed to have been primarily a part of the Kickapoo tribe, were first found in Wisconsin. Moving eastward, they came in contact with the Iroquois, by whom they were driven south into Tennessee. Thence they crossed the mountains into South Carolina, and spread northward as far as New York and southward to Florida. Subsequently they drifted northward, again came in contact with the Iroquois, and were driven over into Ohio. They joined in Pontiac's conspiracy, and during the Revolution fought under the English flag. After the latter war they commenced migrating westward, and finally accepted homes in Indian Territory, where they now are. In 1854 most of them abandoned tribal relations, and divided their lands in severalty. They are now in a civilized and prosperous condition.

The *Crows* or *Upsarokas* are a branch of the Dakota family occupying at present a large reservation in southern Montana, south and east of the Yellowstone river. Their original range included this reservation, and extended eastward and southward, while from their forays no part of the country for many hundreds of miles around was safe. A cowardly tribe, they have ever been noted as marauders and horse stealers. Though they have generally been crafty enough to avoid open war with the whites, they have not scrupled to rob them whenever opportunity offered. Physically they are tall and athletic, with very dark complexions. Their number is about 4200. They have made little if any progress in civilization, preferring to be supported by the Government.

The *Osages* were first found on the lower Missouri, whence they moved south to the Arkansas, and shortly after became allies of the French. After the usual succession of treaties and removals, they finally found themselves in Indian Territory, where they are now fast reaching a condition of self-support. They number about 2100 souls.

The *Kaw* or *Kansas* tribe was originally an offshoot from the Osages. Their original home was in Missouri, whence they were driven to Kansas by the Dakotas. They were moved from one reservation to another, until finally they were placed in Indian Territory, where they are rapidly becoming civilized. They numbered 360 souls in 1879.

The *Winnebagoes* are a branch of the Dakota family. At the time of the advent of the whites they formed the vanguard of the eastward migration of the Dakotas, and were living about Winnebago Lake and Green Bay in Wisconsin. They took up arms on the side of the French in the Franco-English wars, on the side of the English in the Revolution and the war of 1812. In 1820 they numbered about 4500, and inhabited their original home. A series of treaties followed, by which they were moved no less than six times, occupying reservations in various parts of Minnesota and Dakota. At present they are on the Omaha reservation in eastern Nebraska, and are prospering.

The *Otoes* and *Missouries*, which now form one tribe, under the former name, are a branch of the great Dakota family. They were early allies of the French. They now inhabit a small reservation in Nebraska, where they are making gratifying progress. They number but 457.

The *Omahas* were found on St Peter's river, in Minnesota, where they lived an agricultural life, supporting themselves from the soil. After a fatal visitation of the small-pox, which reduced their numbers terribly, they abandoned their village, and wandered westward to the Niobrara river in Nebraska. After a succession of treaties and removals, they are now located on a reservation in eastern Nebraska, where they are rapidly improving in civilization and pecuniary resources. They numbered 1100 in 1878.

The *Poncas* were originally part of the Omaha tribe, with whom they lived near the Red River of the North. They shared the common fate of the weaker tribes in this part of the country, being driven westward by the Dakotas. They halted on the Ponca river in Dakota, and there held their ground, but suffered severely from their hereditary enemies. After a succession of treaties and removals, they were placed on a reservation at the mouth of the Niobrara, where they took lands in severalty, and were prospering greatly, when they were forced to give up their lands and improvements and remove to Indian Territory. Naturally they were extremely dissatisfied with this change, and in 1878 a number of them left the reservation in Indian Territory and made their way back to the Omahas, their former neighbours. They were arrested for leaving the reservation, and were about to be returned to Indian Territory, when the case was taken up by able lawyers, and after a long trial the Indians were set free, it having been decided that they were United States citizens, and therefore not to be confined on reservations. The whole history of the Poncas is a tale of oppression by red men and white.

The *Pawnees* were formerly a brave, warlike tribe, living on the Platte river in Nebraska. Their history, until a recent date, is one of almost constant warfare with the Dakotas. In 1823 their village was burned by the Delawares, and shortly after the tribe lost heavily by the small-pox. In 1874 they moved to a reservation in Indian Territory, where they are making gratifying progress. They number 1440.

The *Caddos*, now located on a small reservation in Indian Territory, are but the remnant of a large tribe that formerly ranged over the Red River country, in Arkansas, northern Texas, and Indian Territory. They have well-managed farms, and are noted for industry and intelligence. Their number is 543.

The *Shoshones* or *Snakes* are a tribe inhabiting the country about the head of the Snake, Green, and Bighorn rivers, in Wyoming, Idaho, and northern Nevada, and distributed mainly on four reservations. They number about 6000. They are a mild, peaceful tribe, but until within a recent period have been involved in almost constant defensive warfare with their neighbours, the Crows and Blackfeet on the north, and the Cheyennes and Arapahoes on the south. The history of their relations with the whites has been one of almost unbroken peace.

The *Bannacks* are a small tribe of the Shoshone family, in the southern portion of Idaho. Their number is about 1000, divided between the Fort Hall and the Lemhi reservations. They have generally been friendly with the whites, although in 1866, and again in 1878, they broke out into hostilities. Very little progress has been made by the tribe.

The *Kiowas* are another tribe of the Shoshone family, a wild, roving people, ranging over the country about the Arkansas and Canadian rivers, in Indian Territory, Colorado, and New Mexico. Formerly their range was very much less restricted, extending from the Platte to the Rio Grande. They have the reputation of being brave warriors, but cruel and treacherous. In recent years they have made repeated raids upon the settlers in western Texas, which have been stopped by the imprisonment of their chief, Satanta. In 1869 they were placed on a reservation in the Indian Territory, which they appear to use only as headquarters for raids into the adjoining country. Their number is given as 1138, but this is undoubtedly too small.

The *Ute* or *Utah* tribe, which is composed of several bands, all acknowledging the authority of one head chief, inhabits reservations in the western part of Colorado and eastern Utah. They number about 4200. Averse to civilization, they have made little or no progress. They originally inhabited the whole mountain region of Colorado and northern New Mexico, whence they made inroads on the plains in pursuit of buffalo, and of their hereditary enemies the Sioux, the Cheyennes, and the Arapahoes. Their intercourse with the whites has been, almost without exception, characterized by friendship. The recent outbreak of the White River band, in 1879, is almost the only case on record. The rapid settlement of the State has driven them westward, and has deprived them of the fairest portion of their domain.

The *Apaches* are a branch of the Athabasca family which has wandered far from the parent region, and now range over large parts of New Mexico and Arizona. It is a powerful, warlike tribe, at war with the whites almost continually since the latter entered the country. A large part of the tribe is on the Fort Stanton reservation in eastern New Mexico, while another portion, under the chief Victoria, has for a long time been devastating the border settlements of New Mexico. The Tonto-Apaches, collected in large numbers on the San Carlos reservation in Arizona, where they are doing something at farming, are of Yuma stock. Besides these, there are several bands of Apaches scattered about on other reservations, or roaming without a fixed habitat, swelling the total to about 10,600 souls.

The *Navajoes* are another tribe of the Athabascan group which is far removed from the body of the family. They inhabit the northern part of Arizona and New Mexico, where they have a fine reservation. They have considerable native civilization, not a few of them engaging in agriculture, and in raising horses, sheep, and goats. They weave blankets, which are prized highly throughout the south-west. They are a fine athletic race, and excellent horsemen. While not an aggressive tribe, they have frequently been at war with the whites. They number now 11,850.

The *Nez Percés*, with the exception of a small portion in Indian Territory, inhabit a reservation in northern Idaho, which includes a part of their ancestral home. They are a fine race, physically and mentally. Until 1877 they had been at peace with the whites. In 1875, a portion of their reservation having been taken from them, owing to the alleged fact that they had not carried out the treaty stipulations, difficulties arose which, two years later, brought on a rupture, and the famous "Nez Percés" war. The disaffected portion of the tribe, numbering some 400 or 500, held out for several months against all the force the Government could bring against them, but were finally captured on the Sweet Grass Hills, in northern Montana. The malcontents were then placed on a reservation in the Indian Territory.

The *Modocs* are a small tribe, which lived in southern Oregon. They are known mainly from their stubborn resistance to the United States Government in 1872 and 1873, known as the Modoc war. This was caused by an attempt to place them upon a reservation. After some preliminary fighting, the Modocs retreated to the "Lava Beds," a basaltic region, seamed and crevassed, and abounding in caves. Here they made a stand for several months before they were finally subdued. During the war General Canby, commanding the troops, and Dr Thomas, a peace commissioner, were treacherously massacred by them while under a flag of truce. The leaders of this revolt were hanged, and the remainder removed to Indian Territory.

The *Pimas*, *Papagoes*, and *Maricopas* form a semi-civilized community, living on a reservation on the Gila and Santa Cruz rivers in Arizona. Originally they were distributed over the whole south-western portion of that territory. Missions were established among them at an early date by the Spanish Jesuits, and with very good success. At present they are mainly self-supporting, while a large proportion of them wear citizens' dress and live in houses. The three tribes now number 10,500.

Pacific Coast Indians.—The Indians upon and near the Pacific coast are divided into a great number of small tribes. Speaking generally, they are lower in the scale of humanity, both physically and mentally, than those of the interior. In northern California, Oregon, and Washington, their principal subsistence was, before the Government undertook their support, the salmon, which in spring crowded the rivers. They are mostly of a mild, peaceful disposition. The Indians of southern California were early taken in charge by the Jesuit missionaries, who Christianized and partly civilized them. Since the settlement of the State by Americans, they have, through neglect, to a large extent relapsed and become worthless members of society.

The name *Pueblo* (city) is used to designate a number of tribes of town-building Indians in New Mexico. They resemble one another very closely in their surroundings, and in their manners and customs; and their history has been the same. Subdued by Coronado in 1540, they made a successful revolt two years later, but were subdued again in 1586. In 1680 they made another unsuccessful revolt. When the country was ceded to the United States in 1848, these Indians were recognized as citizens, and have since remained so. Their houses are communal, generally but one structure for the whole village. They are sometimes built of stone, but oftener of adobe, several stories high, each story receding from the one below. The common plan is a hollow square, or curved figure, though in some cases the form of a pyramid is followed. Some of the towns are built upon high mesas, almost inaccessible, obviously for purposes of defence. These Indians retain their primitive form of government, each village electing a governor and council. They cultivate the soil, raising grain and vegetables for their own consumption, and keep large flocks of sheep and goats. Their number is about 9000.

The *Moquis* are a semi-civilized people living in seven towns on the plateau in northern Arizona. Our first accounts of them date from the expedition of Coronado in 1540. Their history is similar to that of the town-building Indians of New Mexico, except that after a successful revolt against the Spaniards, in 1680, they have remained independent. They are kind-hearted and hospitable, cultivate the soil, raising grain and vegetables, and possessing large flocks of sheep and goats. They weave very fine blankets, an art which they have taught several neighbouring tribes. The houses are built of stone, set in mortar, and for security are perched upon the summits of almost inaccessible mesas. The Moquis numbered 1780 in 1878.

INDIAN ANTIQUITIES.—The ancient remains of the Indians are coextensive with their occupancy of the country, but in general they teach but little concerning their life in prehistoric times. The Atlantic and Gulf coasts are lined with shell-heaps, indicating the sites of ancient villages. Spear or arrow heads are often ploughed up all over the country, relics, it may be, from some well-fought field.

At the copper mines on the northern peninsula of Michigan, there are many evidences that the Indians had been working. Excavations, some of considerable depth, have been found, and in them stone hammers, evidently used in extracting the native copper. Indeed, it is well known that this metal was a common article of commerce among them.

In the south-western territories, however, are found the most interesting remains of this people, in the form of towns, some of great magnitude and extent, built of stone set in mortar. These towns, which were evidently inhabited by a people closely resembling the Moquis and Pueblos, are found in south-western Colorado on the San Juan river and its branches, in north-western New Mexico, in south-eastern Utah, and over the greater part of Arizona. Certain regions appear to have been very densely populated. The largest towns are built in exposed situations, without special precautions for defence, and were plainly inhabited by a mild agricultural race, who were enjoying a period of peace. Others are perched upon high inaccessible mesas, with strong towers for defence and observation, while others, "cave dwellings," are merely walled-in niches in the cliffs of the cañons,—evidently the last refuge of a hunted, desperate people. Everywhere in the neighbourhood of these ruins are vast quantities of fragments of pottery, some of which is painted in the most elaborate designs. Wicker work and arrow and spear heads are also found in abundance. These extensive ruins, scattered over a large area of country, show that at some time in the past this region, now arid and desert, supported a large population of a degree of civilization fully equal to that of the Pueblos and Moquis of the present day, and in all probability their ancestors. (H. G.*)

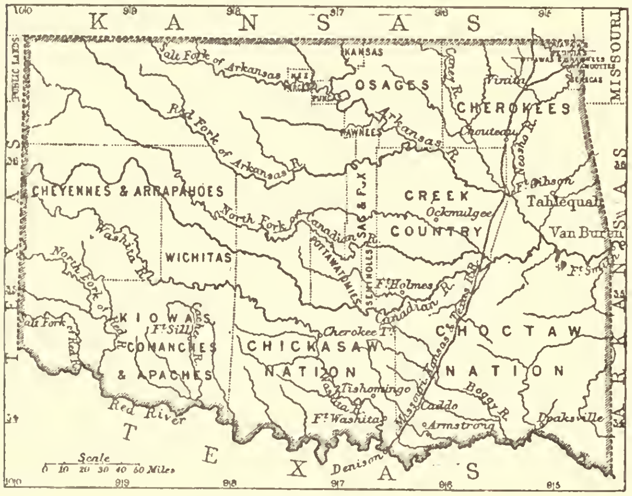
INDIAN TERRITORY

INDIAN TERRITORY is a tract of land in the southern central portion of the United States, which has been set apart as a reservation for the use of various tribes of Indians. It lies between the parallels of 33° and 37° N. lat. and the meridians of 17° and 23° W. long. of Washington (94° and 100° W. of Greenwich). It is bounded N. by Kansas, E. by Missouri and Arkansas, and S. and W. by Texas. The area is estimated approximately at 69,000 square miles. The eastern portion is fertile and well watered, having an annual rainfall of 40 to 50 inches, and a mean annual temperature of about 60° Fahr. The surface is mainly rolling prairie, with broad stretches of rich land along the streams, and an abundance of timber. This section of the territory is separated from the western part, which presents a different aspect, by a broad belt of forest, known as the "Cross Timbers," which extends nearly across the territory in a north and south direction, marking the outcrop of the Carboniferous formation. Its breadth ranges from 40 to 60 miles.

West of this singular strip of forest the country assumes the appearance of the "Great Plains,"—that long incline which stretches eastward from the base of the Rocky Mountains. The surface is a monotonous, rolling, treeless expanse. The valleys are shallow, and the dividing ridges are broad and slightly marked. The climate is comparatively dry, the average annual rainfall being but 20 to 25 inches; and irrigation is needed for the successful cultivation of most crops. The mean annual temperature is somewhat lower than in the east, while the contrast in this regard between summer and winter, day and night, becomes much more marked. Timber is found only in the river valleys, on the faces of bluffs, and among the hills.

The generally level surface of prairies and plains is broken in the southern and south-eastern parts of the territory by ranges and groups of hills, which rise from a few hundred to 1500 feet above the surrounding country. These hills, known as the San Bois Hills, Shawnee Hills, Wichita Mountains, &c., form a part of the Ozark Mountains, which extend eastward over into Missouri and Arkansas.

The principal rivers of the territory are the Arkansas with its branches, the Neosho, the Salt and Red Forks, and the Canadian, with its North Fork, and, in the southern part of the territory, the Red River, which forms the boundary with Texas, and its branch, the Washita. All these are of little or no importance as regards navigation. The eastern part of the territory is well watered, but the western part, except at times of flood, in late spring and early summer, has few flowing streams.



Map of Indian Territory.

The geology of the region is very imperfectly known, as no survey has been made, with the exception of two or three hasty reconnaissances. The general outline of the distribution of geological formations is as follows. The eastern third of the territory is occupied by the Carboniferous formation. In the south-eastern corner, near Red River, it is covered by the Cretaceous. In the eastern portion there are several outcrops of granite, marking the location of groups of the Ozark Hills. The western two-thirds of the territory are covered by Triassic and Jurassic beds, with the exception of the granite mass of the Wichita mountains. The mineral resources are almost totally unknown. It is highly probable that the territory contains extensive deposits of coal, and it is very possible that the precious metals may be found in the Ozark Hills.

The fauna and flora partake of the double character of the surface and climate. In the eastern part they tend toward subtropical types, while the western portion presents forms more or less peculiar to the arid plains. In the eastern part deer, and brown and black bears, are quite abundant, except in the neighbourhood of settlements; and wild turkeys are plentiful. In the western part antelopes and bison are the principal large game; wild horses are still occasionally met with; and various species of grouse, sage hens, owls, rattlesnakes, gophers, and prairie dogs are abundant. The vegetation of the eastern part is profuse, especially in the bottom lands. The forests present a great variety of species very similar to those found throughout the lower Mississippi valley; among them are several species of oak and pine, cypress, red cedar, black walnut, gum tree, &c. Among the wild fruits, which also present much variety, are plums, persimmons, grapes, &c. On the plains of the western part of the territory the principal natural productions are the grasses which, growing in tufts or bunches, are known collectively as bunch or buffalo grass. While this is the prevailing growth, in the more desert localities its place is usurped more or less by artemisia, cactus, and yucca.

Inhabitants.—Besides the Indians who originally inhabited this territory, the United States Government has from time to time moved thither entire tribes or parts of tribes, from more or less distant portions of the country, assigning to each tribe a definite area or "reservation." The immigrants now outnumber very largely the original occupants of the soil. The reservation is, to a certain extent, a prison-house. An Indian is not allowed to leave it without a pass from the agent; nor are whites allowed to settle on it, or even to visit it. Exception is made, however, in the case of white men who marry Indian women. In the case of most of the tribes, the Government holds in trust funds belonging to them derived from the sale of their original land. The income from these funds is paid in the form of subsistence and clothing, live stock, and tools. An agent is appointed for each tribe or group of tribes, for the purpose of regulating its relations with the Government, and of providing and issuing these supplies. With few exceptions, the Indians still retain the tribal organization, although, with their progress in civilization, their forms of self-government have undergone some changes. The five civilized tribes have, besides the principal and the subordinate chiefs, a council, which corresponds in many respects to the legislature of a State. They also have simple codes of laws, and courts to enforce them. The territory has no representation in the national government. For the enforcement of United States laws it is attached to the western judicial district of Arkansas.

It is difficult to obtain correct estimates of the number of Indians in the territory, as many of them lead a wandering life. No accurate census has been taken, and the only data available are the estimates made by the Indian agents. The report of Indian affairs for 1879 contains the estimates given in the following table, which also shows the areas of the different reservations:—

Tribes.	Pop.	Area, sq. miles.	Tribes.	Pop.	Area, sq. miles.
Cheyenne	3593	6715 (Cheyenne and Arapahoe)	Peoria, Miami	184	78
Arapahoe	1903				
Kiowa	1138	5800 (Kiowa, Comanche, Apache, Wichita)	Modoc	99	6
Comanche	1552		Wyandot	260	33
Apache	315		Ottawa	140	23
Wichita	209		Seneca	235	82
Kaw	360	2447 (Kaw, Osage, Quapaw)	Shawnee	800	20
Osage	2135		Sac and Fox	573	750
Quapaw	188		Kickapoo	390	...
Pawnee	1440	442	Pottawattamie	325	900
Ponca	530	301 (Ponca and Nez Percé)			
Nez Percé	370		Cherokee	20,000	7861
Waco	49	...	Creek	14,500	5025
Towaconie	155	...	Choctaw	16,500	10,450
Keechie	75	...	Chickasaw	7000	7267
Caddo	543	...	Seminole	2500	312
Delaware	81	...			

The total number, according to these estimates, is 78,142. The white population living in the territory is very small, consisting almost exclusively of the agents and their dependants, the garrisons at a few military posts, and the employees of the Missouri, Kansas, and Texas Railway, which crosses the eastern portion of the territory.

Several of the tribes, notably the Cherokees, Creeks, Choctaws, Chickasaws, and Seminoles, have made considerable advance in civilization. All the members of the above tribes wear the ordinary dress, live in houses, and are engaged in civilized pursuits. Their occupations are almost entirely farming and stock-raising, principally the former. They support schools, which are attended by a large proportion of the children of the tribes.

The following tables, taken from the report on Indian affairs for 1879, illustrate the progress made by these five tribes:—

	Population.	Number of houses occupied.	Number attending school.	Amount spent on education, 1879.	Number who can read.
Cherokees	20,000	4800	3200	74,000	16,000
Choctaws	16,500	4500	1400	30,000	11,000
Creeks	14,500	4300	800	28,356	3,500
Chickasaws	7,000	1900	650	22,000	2,600
Seminoles	2,500	750	200	2,500	550

Agricultural Products in 1879.

	Acres cultivated.	Wheat, bushels.	Oats and Barley, bushels.	Indian Corn, bushels.	Vegetables, bushels.	Hay, tons.
Cherokees	80,000	350,000	125,000	700,000	150,000	60,000
Choctaws	90,000	140,000	35,000	600,000	85,000	50,000
Creeks	60,000	65,000	20,000	95,000	60,000	50,000
Chickasaws	30,000	10,000	20,000	420,000	40,000	15,000
Seminoles	13,000	400	500	200,000	1,700	1,500

In 1878 there were 263,000 acres in the territory under cultivation by Indian labour; 503,000 bushels of wheat were produced, 3,038,000 of Indian corn, 220,000 of oats and barley, 339,000 of vegetables, and 120,000 tons of hay. The live stock consisted of 59,200 horses, 249,000 cattle, 189,400 swine, and 22,500 sheep.

The population of the five civilized tribes is almost entirely rural. There are no large towns. The principal settlements are Tahlequah, the capital of the Cherokee nation; Caddo in the Choctaw, Muscogee in the Creek, and Tishomingo in the Chickasaw country; and Vinita, a railroad town on the Missouri, Kansas, and Texas line. (H. G.*)

INDIA-RUBBER, or CAOUTCHOUC, consists of the dried coagulated milky juice of various trees and shrubs, belonging chiefly to the natural orders *Euphorbiaceæ*, *Moraceæ*, *Artocarpaceæ*, and *Apocynaceæ*. Although a milky juice is found in plants of many other families, it does not in all cases yield caoutchouc, nor do different species of the same genus yield an equal quantity or quality of that substance. On the other hand, there are many plants which afford a good rubber, but have not yet been sought out for commercial purposes. The milky juice of plants furnishing caoutchouc is contained chiefly in the middle layer of the bark, in a network of minute tubes known to botanists as laticiferous vessels. In the *Apocynaceæ* these vessels are found also in the inner bark, or bast layer. The milky juice above mentioned possesses the properties of a vegetable emulsion, the caoutchouc being suspended in it in the form of minute transparent globules, averaging, according to Adriani, $\frac{1}{12250}$ inch in diameter. Like other emulsions, it is easily coagulated by the addition of an acid or saline solution,—alum or salt water being commonly used for this purpose; but it is said by Mr Bruce Warren not to be coagulated by alcohol. The caoutchouc appears to be kept in suspension in the juice by means of ammonia; at least in some cases the fresh milk exhales an ammoniacal odour. Probably it is on this account that the addition of liquid ammonia prevents the juice from coagulating for a considerable length of time; and the ammonia is in certain districts added when the milk has to be carried some distance from the place of collection. The addition of salt water to the juice is to be deprecated, as it renders the caoutchouc very hygroscopic. The best rubber known is obtained by careful evaporation of the recently strained juice at a moderate heat. Trees are known to contain caoutchouc by the bark on incision yielding a milk that when rubbed between the fingers coagulates into an elastic fibre. The dried bark of such plants when broken shows between the two fractured surfaces of bark a number of silky fibres which can be stretched for some distance without breaking.

Caoutchouc differs from other vegetable products of like origin by possessing considerable elasticity, by being insoluble in water or alcohol, alkalies, and acids (with the exception of concentrated nitric and sulphuric acids). Although apparently simple in constitution, it contains, not only the elastic substance to which its commercial value is due, but a small quantity of an oxidized viscid resinous body soluble in alcohol. This latter substance varies in quantity in different kinds of rubber, those containing the smallest amount, such as the Pará and Ceara, being considered the most valuable, while those in which it is present in greatest proportion, such as the Guatemala and African rubbers, are the least esteemed. Rapid evaporation of the juice, or any means which prevents oxidation, tends to prevent the formation of this viscid resin.

The first notice of india-rubber on record was given nearly five hundred years ago by Herrera, who, in the second voyage of Columbus, observed that the inhabitants of Hayti played a game with balls made "of the gum of a tree," and that the balls, although large, were lighter and bounced better than the wind-balls of Castile (Herrera, *Historia*, dec. i. lib. iii. cap. iv.). Torquemada, however, seems to have been the first to mention by name the tree yielding it. In his *De la Monarquia Indiana*, published at Madrid in 1615, tom. ii., cap. xliii. p. 663, he says, "There is a tree which the [Mexican] Indians call Ulequahuitl; it is held in great estimation and grows in the hot country. It is not a very high tree; the leaves are round and of an ashy colour. This tree yields a white milky substance, thick and gummy, and in great abundance." He further states that the juice was collected and allowed to settle in calabashes, and was afterwards softened in hot water, or the juice smeared over the body and rubbed off when sufficiently dry. The tree mentioned byTorquemada has usually been identified as *Castilloa elastica*, Cerv., but the above account cannot apply to it, as that tree is described by Cervantes as one of the loftiest forest trees of the north-east coast of Mexico, and its leaves are not round but oblong-lanceolate. Torquemada mentions also that an oil was extracted from the "ulli," or rubber, by heat, possessing soft and lubricous properties, and of especial effect in removing tightness of the chest. It was also drunk with cocoa to stop hæmorrhage. Even at that early date the Spaniards used the juice of the ulé tree to waterproof their cloaks. This fact, however, apparently did not attract attention in the Old World, and no rubber seems to have reached Europe until long afterwards. The first accurate information concerning any of the caoutchouc trees was furnished by La Condamine, who was sent in 1735 by the French Government to measure an arc of the meridian near Quito.

In 1751 the researches of M. Fresnau, an engineer residing in Guiana, were published by the French Academy, and in 1755 M. Aublet described the species yielding caoutchouc in French Guiana. Nevertheless india-rubber remained for some time unknown in England except as a curiosity, for Dr Priestley, in the preface to his work on perspective, called public attention to it as a novelty for erasing pencil marks, and states that it was sold in cubical pieces of $\frac{1}{2}$ inch for 3s. each. India-rubber was not known as a product of Asia until 1798, when a plant, afterwards named *Urceola elastica*, Roxb., was discovered to yield it by Mr J. Howison, a surgeon of Prince of Wales Island, and soon afterwards Assam rubber was traced by Dr Roxburgh to *Ficus elastica*, Roxb. It was not, however, until the beginning of the 18th century that the india-rubber industry really commenced. The rapid progress which this has made during the last twenty years may be perceived by a glance at the following table :—

Imported into England in the year			1830,	464 cwts.
,,	,,	,,	1840,	6,640 ,,
,,	,,	,,	1850,	7,616 ,,
,,	,,	,,	1870,	152,118 ,,
,,	,,	,,	1879,	150,601 ,,

It has been computed that in 1870 there were in Europe and America more than 150 manufactories, each employing from 400 to 500 operatives, and consuming more than 10,000,000 ℔ of caoutchouc. The imports into the United States have largely increased during the last few years.

Botanical Sources, Modes of Preparation, &c.

Notwithstanding the fact that caoutchouc-yielding trees are found in a large belt of countries around the globe, including at least 500 miles on each side of the equator, yet the demand for the best qualities of india-rubber is in excess of the supply. The varieties which are almost exclusively used when great elasticity and durability are required are the Pará, Ceara, and Madagascar rubbers.

The principal forms of caoutchouc which are imported into Great Britain may be grouped under four heads, the order in which they are here placed indicating their respective values :—*South American*—Pará, Ceara, Pernambuco, Maranhão, Cartagena, Guayaquil; *Central American*—West Indian, Guatemala; *African*—Madagascar, Mozambique, West African; *Asiatic*—Assam, Borneo, Rangoon, Singapore, Penang, and Java. Of all these, the most important is the Pará, the imports of which, according to Messrs Hecht, Levis, & Kahn, have increased from 1670 tons in 1857 to 8000 tons in 1879. For this rubber and the Mozambique variety the demand increases every year,—an unerring indication of their value.

FIG. 1.—*Hevea brasiliensis.*

I. SOUTH AMERICAN.—*Pará rubber* is obtained chiefly from *Hevea brasiliensis*, Müll. Arg., a large euphorbiaceous tree upwards of [illegible] in height, branching from the base, and having trifoliate leaves, the leaflets being lanceolate and tapering at both ends (figs. 1, 2). Other species of *Hevea*, as well as *Micrandra siphonoides* and *M. minor*, Benth., all of which grow abundantly in the moist steamy valleys of the Amazon and its tributaries, are also used indiscriminately by the natives to furnish Pará rubber. These trees are found in different districts, but all flourish best on rich alluvial clay slopes by the side of rivers, where there is a certain amount of drainage, and the temperature reaches from 89° to 94° at noon and is never cooler than 73° at night, while rain is rarely absent for ten days together. The genus *Hevea* was formerly called *Siphonia*, and the tree named Pao de Xerringa by the Portuguese, from the use by the Omaqua Indians of squirts or syringes made from a piece of pipe inserted in a hollow flask-shaped ball of rubber.

The caoutchouc is collected in the so-called dry season between August and February. The trees are tapped in the evening, and the juice is collected on the following morning. To obtain the juice a deep horizontal incision is made near the base of the tree, and then from it a vertical one, extending up the trunk, with others at short distances in an oblique direction. Small shallow cups made from the clayey soil and dried in the sun are placed below the incisions to receive the milk, each cup being attached by sticking a piece of soft clay to the tree and pressing the cup against it. The juice, of which each tree yields only about 6 ounces in three days, has a strong ammoniacal odour, which rapidly goes off, and in consequence of the loss of ammonia it will not keep longer than a day unchanged, hence when it has to be carried to a distance from the place of collection 3 per cent of liquid ammonia is added. The juice is said by Bruce Warren to yield half its weight of caoutchouc, but 32 per cent. appears to be the usual quantity. To obtain the rubber the juice is heated in the following manner. A piece of wood about 3 feet long, with a flattened clay mould at one end of it, is dipped in the milk, or this is poured over it as evenly as possible. The milk is then carefully dried by turning the mould round and round in a white vapour obtained by heating certain oily palm nuts, those of *Attalea excelsa* being much preferred, and the vapour being confined within certain limits by the narrowness of the neck of the pot in which the nuts are heated. Each layer of rubber is allowed to become firm before adding another; a practised hand can make 5 or 6 ℔ in an hour. From whatever cause, the rubber thus prepared is the finest that can be obtained. The cakes when completed are, in order to remove them from the mould, slit open with a sharp knife, which is kept wet, and are hung up to dry. The flat rounded cakes of rubber made in this manner are known in the London market as "biscuits." They rarely contain more than 15 per cent. of moisture. The scrapings from the tree, which contain fragments of wood, are mixed with the residues of the collecting pots and the refuse of the vessels employed, and are made up into large rounded balls, which form the inferior commercial quality called "negrohead," and often contain 25 to 35 per cent. of impurity. An intermediate quality is known as "entrefine." Pará rubber is said to be sometimes adulterated with the juice of the Maçandaruba tree (*Mimusops elata*), which might account for the great differences that have been occasionally observed in the behaviour of Pará rubber in certain stages of manufacture, the coagulated juice of the *Mimusops* genus resembling gutta percha rather than caoutchouc.

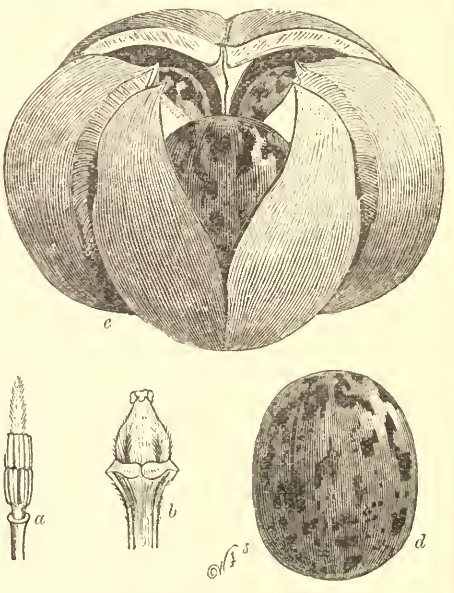


FIG. 2.—*Hevea brasiliensis.* *a*, male flower, and *b*, female flower (both enlarged, and with the floral envelope removed); *c*, ripe fruit, and *d*, seed (both natural size).

Previous to 1860 Pará rubber was exported only in small quantities, and then chiefly in the form of shoes; this variety ceased to be sent over in 1852. Occasionally "negrohead" has been imported in grotesque forms of animals, &c., and the better qualities in the shape of small bottles moulded in soft clay which has been afterwards washed out by water.

In British Guiana rubber is obtained from *Hevea paucifolia*, Müll. Arg.; in French Guiana from *H. Guayanensis*, Aubl., where it is known as "heve," "siringa," or "cahoutchou,"—the last being the probable origin of the name caoutchouc; and in Venezuela from *H. brasiliensis*, there called dápi or dápiche. None is exported to England from any of these localities. Small quantities of rubber intermediate in character between that of Pará and Pernambuco are occasionally imported from Maranhão. On account of its great value as a source of caoutchouc, the cultivation of the Pará rubber tree has been attempted in India; but it has been found to be too tropical a plant for cultivation in northern and central India, although suitable for Ceylon, Malabar, and South Burmah, according to recent reports. The seeds, which are about the size of a damson (fig. 2, *d*), soon lose their vitality, and cuttings do not thrive unless taken from the young wood.

Ceara rubber is considered almost next to the Pará in value, as it is a "dry" rubber, very elastic and free from stickiness; but it often contains a quantity of wood and foreign matter arising from the mode of collecting it, the loss in washing previous to manufacture amounting sometimes to 25 per cent. It is the produce of *Manihot Glaziovii*, Müll. Arg., a euphorbiaceous tree common in the province of Rio Janeiro, about 30 feet high, with a rounded head of foliage, and greyish-green 3- to 7-lobed palmate leaves, somewhat resembling the leaves of the castor-oil plant in shape and size (figs. 3, 4, 5). The trees are tapped, according to Mr R. Cross, when the trunk attains a diameter of 4 to 5 inches, *i.e.*, when they are about two years old. The mode of collecting the rubber is as follows. After brushing away the loose stones and dirt from the root of the tree by means of a handful of twigs, the collector lays down large leaves for the milk to drop upon. He then slices off the outer layer of the bark to the height of 4 or 5 feet. The milk, which exudes in many tortuous courses, some of it ultimately falling on the ground, is allowed to remain on the tree for several days, until it becomes dry and solid, when it is pulled off in strings, which are either rolled up into balls or put into bags in loose masses, in which form it enters commerce under the name of Ceara "scrap." The amount of Ceara rubber imported in 1879 amounted to 500 cwt. The attempts which have been recently made to cultivate this rubber plant in India have been attended with signal success. In Rio Janeiro it grows in a rocky or stony arid region, where a short underscrub is the only vegetation, and the atmosphere is hot and dry, the temperature ranging from 82° to 90° Fahr. It is, therefore, suited for cultivation where the *Hevea* will not grow. In Ceylon it has been found to thrive at an altitude of from 200 feet to 3000 feet above the sea level. At Zanzibar and Calcutta also it succeeds well. The seeds (fig. 5, *c*), which have a hard thick coat, take a year in germinating, unless the edges near the end bearing the caruncular projection are rasped off. Cuttings, provided they have a single bud, strike readily.

FIG. 3.—*Manihot Glaziovii.* (After H. Trimen, *Journ. Bot.*, Nov. 1880.)

Pernambuco or *Mangabeira rubber* is obtained from *Hancornia speciosa*, Gom., an apocynaceous tree common on the South American plateau in Brazil from Pernambuco to Rio Janeiro, at a height of 3000 to 5000 feet above the sea. It is about the size of an ordinary apple tree, with small leaves like the willow, and a drooping habit like a weeping birch, and has an edible fruit called "mangaba," for which, rather than for the rubber, the tree is cultivated in some districts. Only a small quantity of this rubber comes to England, and it is not much valued, being a "wet" rubber. It occurs in "biscuits" or "sheets." The caoutchouc is collected in the following manner. About eight oblique cuts are made all round the trunk, but only through the bark, and a tin cup is fastened at the bottom of each incision by means of a piece of soft clay. The cups when full are poured into a larger vessel, and solution of alum is added to coagulate the juice. In two or three minutes coagulation takes place, and the rubber is then exposed to the air on sticks, and allowed to drain for eight days. About thirty days afterwards it is sent to market. Pernambuco rubber, as is the case with most rubbers coagulated by saline solutions, contains a large quantity of water.

FIG. 4.—*Manihot Glaziovii.* Young leaf (half natural size); inflorescence (about half natural size); half-ripe capsule (real size).

Cartagena rubber comes from New Granada in the form of black sheets ¾ inch thick, having a somewhat rough or "chewed" appearance, and is more or less "tarry" or sticky. It also occurs in the form of strips or small pieces pressed together in bags. Its botanical source is not known, but is thought to be a pinnate-leaved tree, a portion at least being derived, it is supposed, from *Castilloa elastica*. It loses 35 per cent. of moisture when dried. The importation of Cartagena rubber into Great Britain has declined from 3518 cwts. in 1875 to 1679 cwts. in 1879.

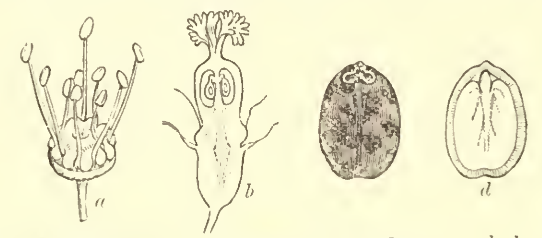

FIG. 5.—*Manihot Glaziovii.* *a*, male flower; *b*, female flower; *c*, seed; *d*, section of seed. (All natural size.)

Guayaquil rubber is imported from Ecuador in large flakes or lumps, of a whitish colour in the best kinds, the inferior sorts being porous and filled with a fœtid black liquid, having an odour of cow-dung, and staining the knife and hands. It is believed to be obtained from *Castilloa elastica*. The amount imported into Britain has diminished from 3815 cwts. in 1875 to 482 cwts. in 1879. In washing for manufacture it sometimes loses up to 40 per cent. of its weight. The bulk of the two last-mentioned rubbers is exported to the United States.

II. CENTRAL AMERICAN.—The source of all the principal rubbers exported from Central America is *Castilloa elastica*, Cerv., a lofty artocarpaceous tree, with a trunk 3 feet or more in diameter, and large hairy oblong lanceolate leaves often 18 inches long and 7 inches wide, those subtending the young branches being much smaller and more ovate (fig. 6). The tree grows most abundantly in a sporadic manner in the dense moist forests of the basin of the Rio San Juan, where the rain falls for nine months in the year. It prefers rich fertile soil on the banks of watercourses, but does not flourish in swamps. It is found also in Costa Rica, Guatemala, Honduras, Mexico, Cuba, and Hayti, and in Panama in company with another species, *C. Markhamiana*, Collins, and on the west coast of South America down to the slopes of Chimborazo, the Cordilleras of the Andes separating the *Castilloæ* from the *Heveæ* of Brazil, according to Mr R. Spruce.

Nicaragua rubber.—In Nicaragua the juice is collected in April, when the old leaves begin to fall and the new ones are appearing, during which time the milk is richest. The tree is tapped either in the same manner as the *Hevea*, or by encircling the tree with a simple

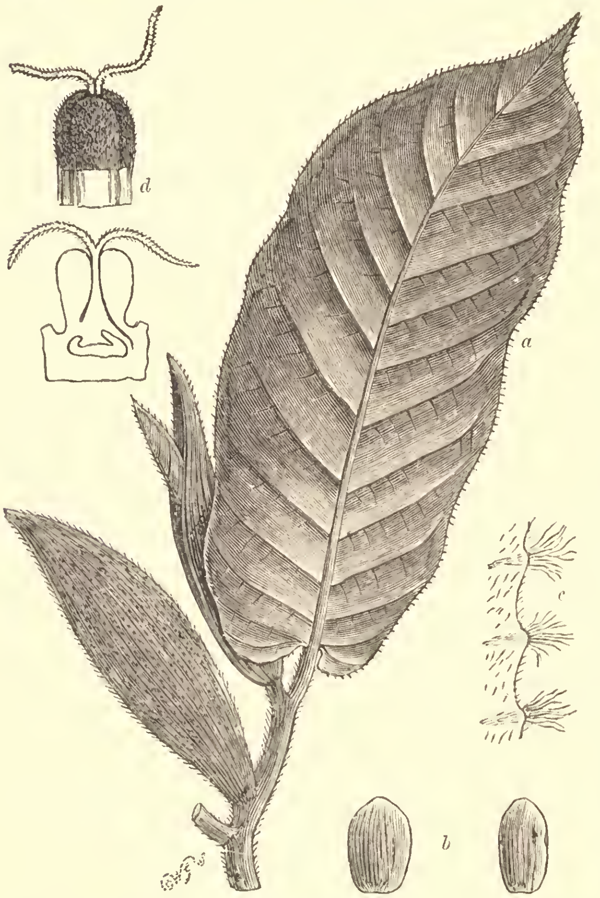

FIG. 6.—*Castilloa elastica.* *a*, young leaf (quarter real size); *b*, seeds (natural size); *c*, margin of leaf (enlarged); *d*, female flower and section of it (enlarged).

spiral cut at an inclination of 45°, or by two spirals in opposite directions if the tree be large. At the bottom of the spiral an iron spout about 4 inches long is driven into the tree, and the milk is received in iron pails. A tree 20 to 30 feet high to its first branches, and about 4 feet in diameter, is expected to yield 20 gallons of milk, each gallon giving about 2 lb of rubber. In the evening the milk is strained through a wire sieve and transferred to barrels. The milk is coagulated by the addition of the juice of the "acheté" plant (*Ipomœa bona-nox*, L.) or of another plant called "coasso." The strained juice of either of these plants, obtained by bruising the moistened herb and subsequent expression, is added to the milk in the proportion of about 1 pint to the gallon. If these plants are not procurable, two parts of water are added to one of the milk, and the mixture allowed to stand for twelve hours. The coagulum is next flattened out by a wooden or iron roller to get rid of the cavities containing watery liquid, and the sheets are then hung up for fourteen days to dry, when they weigh about 2 lb, the sheets being usually ½ to ¼th inch thick and 20 inches in diameter. When coagulated by water, the mass is placed in vats in the ground and allowed to dry, this taking place in about a fortnight. It is then rolled into balls. That which dries on the incisions in the tree is called bola or burucha, and is said to be highly prized in New York. The loss of Nicaragua rubber in drying is estimated at 15 per cent. It is exported chiefly from San Juan del Norte, or Grey Town, and the larger proportion goes to the United States. The *Castilloa* appears to be suitable for cultivation only in districts where the Pará rubber would grow equally well. The deciduous lateral shoots if planted will never grow erect.

West Indian rubber is the variety usually imported into England, but in comparatively small quantity only. It occurs in the form of blocks, the finest quality consisting of thin separable sheets, and the second of "scraps," usually conglomerated and containing fragments of bark. It is the best description of Central American rubber known. It is not, as its name seems to imply, produced in the West Indies, but derives its appellation from being brought over in West Indian steamers.

Honduras rubber rarely comes over to England; it is of good quality, and free from "tarry" matter.

Mexican rubber is imported into Liverpool in small quantity only. The imports of Mexican caoutchouc decreased from 1292 cwts. in 1875 to 158 cwts. in 1879.

Guatemala rubber is a very inferior kind and very unequal in quality; the best varieties are whitish, and the "lower" are black with a "tarry" appearance. It occurs in the form of sheets compacted together, from between which when pressed a thick resinous fluid exudes. This when evaporated leaves a hard resinous substance unaffected by hot water or steam. The rubber is collected from the trees as in Nicaragua, but it is poured on mats to dry, and the thin sheets are subsequently peeled off, folded into squares, and subjected to pressure to remove as much as possible of the contained moisture. The imports of india-rubber into England from the whole of Central America amounted only to 2080 cwts. in 1879, having decreased from 5809 cwts. in 1875. The greater proportion of Central American rubber is exported to New York, especially that from Nicaragua and Panama.

Siphocampylus Caoutchouc, Don., and *S. Jamesonianus*, D. C., Central American plants belonging to the natural order *Lobeliaceæ*, are also stated to yield rubber of good quality; and at the Philadelphia exhibition a rubber called Durango caoutchouc, obtained from a composite plant, was exhibited.

III. AFRICAN.—India-rubber is produced throughout equatorial Africa, the chief districts of export being the Gaboon, Congo, and Benguela on the west coast, and Madagascar, Mozambique, and Mauritius on the east. The Madagascar, Mauritius, and Gaboon rubbers are, it is believed, chiefly exported to France. Those which enter into British commerce are known as Mozambique, Madagascar, and African, although the imports are described as coming from the following districts in the blue books:—Senegambia and Sierra Leone 3808 cwts., West Coast 11,307 cwts., East Africa 7621 cwts., Cape of Good Hope 4241 cwts., Mauritius 570 cwts., Gold Coast 12 cwts. The above imports, which are for 1879, show an increase during the past five years, except in the case of Mauritius, Madagascar, and the Gold Coast. Africa, in respect of the large amount exported, may now be considered as taking the second place as an india-rubber producing continent.

Mozambique rubber, which is one of the most important varieties, occurs in the form of balls about the size of an orange, and "sausages," or spindle-shaped pieces, made up of slender strings of rubber wound around a piece of wood, which is eventually removed; or sometimes it occurs in smooth pieces of irregular size known as "cake" or "liver." *Madagascar rubber* consists of two qualities, the best of a pink and the inferior or "lower" of a black colour, and occurs in shapeless pieces.

The other kinds included under the general name of African are amorphous lumps called "knuckles" from Congo; small "negroheads" or "balls" of scrap, and smooth cakes from Sierra Leone; small square pieces like dice called "thimbles," and others more irregular in shape called "nuts," and "small negroheads" from the Portuguese colonies; "tongues," consisting of flat pieces, usually wet and sticky, from the Gaboon; and "balls" from Liberia African rubber as a rule possesses more adhesiveness and less elasticity than Pará rubber, and is inferior in value. Comparatively little is known of the plants yielding caoutchouc in Africa or of the mode of collection. In Angola, according to Dr Welwitsch, the natives either cut off a piece of bark, and allow the milky juice to run into a hole in the ground, or placing the hand against the trunk of the tree permit the milk to trickle down their arms, going from tree to tree until the arm is covered, when the rubber is rolled back towards the hand in the form of a ring. The wood of some of the trees, according to Mr Collins, contains a gum which, if the incision penetrates below the bark, mixes with the rubber and deteriorates it. In Madagascar, according to M. Coignet, rubber is obtained from the "Voà-héré" or "Voà-canja," *Vahea madagascariensis*, Boj., the "Voà-hiné, *V. comorensis*, Boj., and from *V. gummifera*, Lam. In Senegambia it is obtained from the "Anjouan," *Vahea senegalensis*, A. D. C. In Mauritius *Willughbeia edulis*, Roxb. (which is found also in Madagascar, and in Chittagong and Silhet in India), appears to be the chief source of rubber. All the above are climbing shrubs with opposite entire leaves and fleshy fruits.

In Central Africa, from Liberia on the one side to Zanzibar or the other, caoutchouc is collected from plants of genera nearly allied to *Vahea*, a few only of the species being known to botanists. In Angola, under the name of "Licomgue," in Golungo Alto and Cazengo, it is collected from *Landolphia owariensis*, Pal. de Beauv.; from *L. florida*, Benth., in Angola and Liberia, and from *L. Heudelotii*, D. C., in Senegal. At Kew there also exists a specimen of india-rubber from the west coast of Africa obtained from an undescribed species of *Carpodinus* with hairy leaves and stems. In the basin of the Gaboon and Congo it is obtained, according to Du Chaillu, from a climbing plant called *N'dambo*, which gives its name to dambonite, a peculiar substance contained in this kind of rubber (see p. 840). That some African caoutchouc is yielded by species of *Ficus* there can be no doubt. In Sierra Leone it is collected from *Ficus Brasii*, R. Br. In Liberia, according to Mr Thomas Christy, the finest rubber is obtained from *Urostigma Vogelii*, Miq., a tall tree with large handsome leaves, and lower qualities of rubber from other species, and from *Landolphia florida*, Benth. In Angola on the west, and at Inhambane on the east coast, rubber is also obtained from species of *Ficus*. In the island of Réunion caoutchouc is said to be obtained from *Periploca græca*, L.

IV. Asiatic.—The rubbers which enter English commerce from Asia include the Assam, Borneo, Rangoon, Singapore, Penang, and Java kinds.

Assam rubber is imported chiefly from Calcutta in baskets made of split rattans, weighing about 3 cwt. each, and covered with a gunny bag. The rubber is glossy, of a bright pink colour and mottled appearance, and occurs in the form either of small balls pressed together or of irregular masses called "slabs" or "loaf" rubber. The former, being more liable to adulteration, are less in demand by manufacturers. The imports into Liverpool in 1879 were 7000 cwts. Assam rubber is obtained from *Ficus elastica*, Roxb., a plant too well known as a window ornament to need description. A portion also is collected from *Urostigma laccifera*, Miq. *Ficus elastica* grows in the tropical rocky valleys of the Himalayas, between 70° and 80° E. long., where there is always a hot moist atmosphere, the temperature rising to 98° F. in the shade. The trees are tapped in the most careless manner. In the lower portion of the tree and in the large aerial roots, diagonal cuts penetrating to the wood are made, from 6 to 18 inches long, and in an elliptical form so as to be about 3 inches across the centre. The milk is received either in holes made in the ground or in leaves folded in the form of a funnel, that from the smaller cuts on the branches (for the collectors scarify every portion within reach) being allowed to dry on the tree. About 50 oz. of the milk collected in August gives 15 oz. of caoutchouc, but the percentage sometimes falls as low as 10 per cent. From February to April the milk is more scanty, but richer in caoutchouc, and is consequently best collected at that time. The milk is coagulated by pouring it into boiling water and stirring it until it is sufficiently firm to be carried about without being clammy; sometimes it is pressed, again boiled, and dried in the sun. In this way the "loaf" rubber in irregular masses is formed. The small "balls" are formed of the strings of rubber which have been allowed to dry on the tree.

Assam rubber, although fairly elastic, is much depreciated in value by the careless mode of collection, and often loses, by washing at the manufactory, as much as 35 per cent. of dirt, consisting of clay, sand, or bark. The exportation of caoutchouc from British India, exclusive of the Straits Settlements and Ceylon, in 1879 amounted to 9973 cwts., of which 7000 are estimated to have been produced in Assam. About three-fourths of the rubber exported from India goes to Great Britain, and the remainder to the United States.

In consequence of the reckless destruction of the trees, the cultivation of *Ficus elastica* has been commenced in Assam. It is calculated that the trees can be tapped at the age of twenty-five years, and that after fifty years they will yield 40 lb of caoutchouc each (worth £3, 4s.) every three years, it being injurious to their health to tap them more frequently.

Falay rubber is the product of *Cryptostegia grandiflora*, R. Br., an asclepiadaceous plant common on the coast of India; and from *Willughbeia edulis*, Roxb., and *W. martabanica*, D. C., a rubber is obtained in Chittagong; neither of these, however, is known in Britain as a commercial variety.

Borneo rubber comes to the Liverpool market in the form of balls or shapeless masses, internally of a white or pinkish colour, and very porous and spongy, the pores being usually filled with salt water, in consequence of which it often loses 20 to 50 per cent. of its weight in drying. The imports into Great Britain amounted in 1879 to 5000 cwts. Although Borneo rubber was first made known in 1798, it was not imported into England as an article of trade till 1864, when it appeared under the name of gutta susu, *i.e.*, in Malayan, milk-gum. The plant which yields Borneo rubber was identified by Roxburgh as *Urceola elastica*, Roxb., an apocynaceous climbing plant with a trunk as thick as a man's body, and having a soft thick bark. Mr F. W. Burbidge, who recently visited the island, states that there are three varieties of the rubber plant, known to the natives as "petabo," which yields the finest caoutchouc; "menoongan," which yields the largest quantity; and "serapit," from which the commonest rubber is obtained. The petabo variety, according to specimens at Kew, is referred to a species of *Leuconotis*. The rubber is obtained by cutting the plant into pieces varying from a few inches to 2 or 3 feet long, and allowing the juice to drain into buckets or jars, heat being sometimes applied to one end of the pieces when the juice flows slowly. The milk is coagulated by salt water. The Borneo rubber plant is probably one of the plants that would repay cultivation, as it grows rapidly, yields a supply of sap in three years, and after planting requires no attention.

In Sumatra, caoutchouc is obtained from *Willughbeia firma*, and is exported to Holland, but this variety is not known in England. Malacca rubber, which is not met with in English commerce, is said to be obtained from *Urceola elastica*, Roxb.

Rangoon rubber, and those of Penang and Java, are imported into England in small quantities only, and are irregular in appearance. From its physical characters, a portion at least of Rangoon rubber is believed to be the produce of a species of *Ficus*, probably *F. hispida*, L. Another caoutchouc-yielding plant, *Urceola* (*Chavannesia*) *esculenta*, Benth., belonging to the *Apocynaceæ*, has, however, been recently discovered in Burmah, some specimens of which at the age of five years have stems 6 inches in diameter, while the crown covers an area of 200 square feet. It has been recommended for plantations as an available source of rubber, the cost of cultivation being very slight after the first year, and the profit commencing in seven years, at which age the yield is calculated to be 3½ lb.

Penang rubber in character resembles the Assam, and may be also supposed to be obtained from a species of *Ficus*. Dr Wallich, however, has stated that its source is an asclepiadaceous plant, *Cynanchum ovalifolium*, Wright.

Java rubber is stated by Dr De Vrij to be obtained from *Ficus elastica*. Like the Assam rubber it is dark and glossy, but it is of a deeper tint, and has occasional reddish streaks. It is said to be prepared by allowing the juice to dry on the incisions made in the tree. Singapore, Java, and Penang rubbers are much alike in character, and may be classed with the Assam rubber, having a firm texture, mottled appearance, and bright polished surface, but varying in colour in a single sample from light yellowish-white to dark brown. Java rubber is also exported to France.

Caoutchouc is obtained in the Malay archipelago from *Alstonia costulata*, Miq.; and *Alstonia scholaris*, R. Br., is likewise reported to yield it. In Fiji it has been obtained from *Alstonia plumosa*, Labill. In North Australia caoutchouc has been prepared from *Ficus macrophylla*, Desf., and *F. rubiginosa*, Desf.; the last-named plant has been recommended by Baron Müller as suitable for cultivation, being a hardy species. None of the above rubbers are as yet known in British commerce as regular articles of trade.

Chemistry, Manufacture, and Industrial Uses.

The remarkable body known as india-rubber is composed of carbon and hydrogen alone, but its exact chemical nature is not by any means known with certainty. The analyses of Faraday indicate that its ultimate composition is 87·5 per cent. of carbon and 12·5 per cent. of hydrogen; but there appears to be good ground for regarding the substance as a polymer of the group $C_{10}H_8$, or as $(C_{10}H_8)_x$. There are, however, no data for estimating the value of x in this case. It will be noticed, too, that the formula given requires considerably less hydrogen than the proportion indicated by Faraday's analysis; but the difficulties of obtaining such a body as caoutchouc in a fit condition for analysis are so great as to render this discrepancy a matter of comparatively small import. The action of cold and heat on india-rubber presents many points of interest. When exposed to a temperature approaching 0° C., it gradually loses its softness and ready extensibility, and finally becomes rigid and inelastic; but its normal condition may be restored by submitting it either to a temperature of 35° or 40° C., or to a tension sufficient to stretch it to about twice its natural length. In the latter case it is probable that the change is really due to heat arising from the physical disturbance consequent upon the act of stretching. The effects of heat are more complex and varied than those of cold; and with caoutchouc at an ordinary temperature, say 15° C., the primary effect of heat is to increase its flexibility and elasticity. This is well illustrated by the fact that a strip of rubber stretched by a weight contracts when it is heated to a temperature of about 40° C. This diminution as regards length is, however, accompanied by a more than corresponding increase in thickness, on account of the expansion in volume due to an elevated temperature. When caoutchouc is exposed to a temperature ranging between 100° and 120° C., it becomes considerably softened, and almost entirely loses its elasticity; but, if of good quality, it slowly recovers its former condition under the influence of a moderate degree of cold. When, however, the heat is pushed to 150°, it becomes viscous, and at 200° it fairly melts, forming a thick liquid which possesses the same composition as ordinary caoutchouc, but has no tendency to resume its original condition even when exposed to cold for a prolonged period. At a still higher temperature, caoutchouc yields a variety of volatile hydrocarbons; and, on subjection to dry distillation in a retort, its conversion into these bodies is tolerably complete, only a trifling carbonaceous residue remaining behind. Among the most notable volatile products resulting from the dry distillation of caoutchouc may be mentioned *caoutchin*, an oil-like body having a composition and vapour volume corresponding to the formula $C_{10}H_8$, and boiling at 171° C.; and *isoprene*, another hydrocarbon oil identical in composition with caoutchin and with caoutchouc itself, and boiling at 38° C. Other hydrocarbon oils are also formed, as, for example, *heveene* and *caoutchene*,—these being members of the C_nH_{2n} series. The former boils at 228°, and the latter at 14°·5. The mixed products of the dry distillation of caoutchouc, often described under the name caoutchoucin, form an excellent but rather expensive solvent of this body. When exposed to the air, caoutchouc gradually oxidizes and undergoes deterioration; the oxidation is often much favoured by exposure to sunlight or to alternate conditions of dampness and dryness. The deteriorated caoutchouc is either somewhat soft and deficient in tensile strength, or brittle and resinous in its nature. Spiller found 27·3 per cent. of oxygen in a resinous product resulting from the decay of caoutchouc. Ozone rapidly attacks and destroys the substance.

Dilute acids or alkalies have little or no action on caoutchouc, but strong and hot sulphuric acid chars, and concentrated nitric acid rapidly oxidizes and destroys it. The moderate action of either chlorine, bromine, or iodine hardens or vulcanizes it; but, if allowed to act freely, they completely destroy it. The action of sulphur will be considered below.

Caoutchouc, when pure, is odourless and nearly white, and possesses a specific gravity of ·915. It is porous and cellular in texture, and absorbs from 10 to 25 per cent. by weight of water when long soaked in it. Alcohol is similarly taken up. Up to this point caoutchouc has been referred to as if it consisted of one substance only; but as a matter of fact all ordinary samples contain two distinct modifications, viz., the hard or fibrous and the soft or viscous. These two caoutchoucs are identical in composition, and similar as regards general properties and reactions. On subjecting a piece of raw caoutchouc, however, to the action of such a solvent as cold benzol, the essential difference between the two forms manifests itself. The fibrous or hard constituent merely swells up to many times its original bulk, but the viscous yields a true solution. In a high class rubber, such as that imported from the province of Pará, the former modification is the principal factor; in a caoutchouc of low quality, such as "African tongue," the latter. Freshly cut surfaces of caoutchouc unite together firmly, and this circumstance is due to the presence of the viscous variety; vulcanization, by hardening this, destroys the adhesive property.

Certain liquids, such as benzol and its homologues, carbon disulphide, petroleum, ether, volatile oils, chloroform, and melted naphthalene, dissolve caoutchouc more or less perfectly; but unless the substance has been subjected to the process of mastication, its fibrous constituent appears, not to dissolve in the strict sense of the term, but rather to swell up, forming a paste analogous to starch which has been acted on by hot water. Carbon disulphide and chloroform, however, exercise a more powerful solvent action on the fibrous parts of india-rubber than benzol or essential oils; and Payen has found that carbon disulphide to which 5 per cent. of absolute alcohol has been added forms one of the best solvents. One part of masticated caoutchouc dissolved in thirty parts of this solvent forms a liquid which can be filtered through paper, and which leaves a film of exquisite tenuity and purity when allowed to dry on a level glass plate.

Most fatty matters exercise a remarkable destructive action on caoutchouc, causing it to become first soft, and afterwards hard and brittle. It has often happened that traces of fatty oils in the liquids employed for dissolving india-rubber, or fatty matters in the textile basis, have led to the destruction of waterproof goods. A like cause has in many cases led to the rapid deterioration of the caoutchouc threads in elastic webbing.

In the industrial working of india-rubber, the first matter to be attended to is the removal of the various impurities present in the crude material. These are in some cases natural products which have originated with the caoutchouc, while in other cases they owe their presence to careless collection or to adulteration. Among the impurities of the former class may be mentioned various gum-like or mucilaginous matters, and acid products arising from their decay or oxidation. A remarkable volatile body, which is probably of the nature of a polyatomic alcohol, has been discovered by Gerard[1] in the crude caoutchouc from the Gaboon. This substance, called by the discoverer *dambonite*, has a composition corresponding to the formula $C_4H_8O_3$, is sweetish to the taste and soluble in water, and crystallizes in needles which melt at 190° C. and volatilize between 200° and 210°. The admixtures may range from fragments of bark or wood to stones or large lumps of clay, such as are sometimes introduced into negrohead rubber,—hay or a similar substance being also placed inside to make the mass about equal in specific gravity to the genuine article. Alum and sulphuric acid are often employed to effect the coagulation of the juice; and traces of the latter remaining in the rubber appear, in some instances, to work mischief.

All the above-mentioned impurities are in actual practice very efficiently removed by the following process. The lumps of crude caoutchouc are first softened by the prolonged action of hot water, and then cut into slices by means of a sharp knife,—generally by hand, as thus any large stones or other foreign substances can be removed. The softened slices are now repeatedly passed between grooved rollers, known as the washing rollers (fig. 7), a supply of hot or cold water being made to flow over them. Solid impurities speedily become crushed, and are carried away by the water, while the rubber takes the form of an irregular sheet perforated by numerous holes. The washed product contains in its pores a notable proportion of water, which is removed by hanging the rubber for some days in a warm room. It is now ready either for incorporation

[1] *Compt. Rend.*, lxvii. p. 820, and *Zeitschrift für Chem.*, 1869, p. 66.

with sulphur and other solid bodies, or for agglomeration into solid masses by means of the masticating machine,—an apparatus which consists of a strong cylindrical cast-iron casing, inside which there revolves a metal cylinder with a fluted or corrugated surface. Some of the rubber having been placed in the annular space between the inner cylinder and the outer casing, the former is made to revolve; and the continued kneading action to

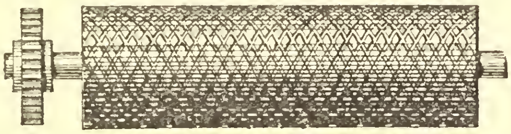

Fig. 7.—Roller of Washing Machine.

which the rubber is subjected works it into a solid mass, something like a gigantic sausage. Before commencing the mastication it is generally necessary to warm the apparatus by means of steam; but as the operation proceeds the heat produced requires to be moderated by streams of cold water flowing through channels provided for the purpose. The inner cylinder is generally placed somewhat excentrically in the outer casing, in order to render the kneading more perfect than would otherwise be the case.

To convert the masticated rubber into rectangular blocks, it is first softened by heat, and then forced into iron boxes or moulds. The blocks are cut into thin sheets by means of a sharp knife, which is caused to move to and fro about two thousand times per minute, the knife being kept moistened with water, and the block fed up to it by mechanical means. Cut sheets are largely used for the fabrication of certain classes of rubber goods,—these being made by cementing the sheets together with a solution of rubber in coal-naphtha or benzol. Most articles made of cut sheet rubber would, however, be of very limited utility were they not hardened or vulcanized by the action of sulphur or some compound of that element. After vulcanization, rubber is no longer softened by a moderate heat, a temperature of 160° C. scarcely affecting it, nor is it rendered rigid by cold, and the ordinary solvents fail to dissolve it. It must, however, be distinctly understood that it is not the mere admixture but the actual combination of sulphur with india-rubber that causes vulcanization. If an article made of cut sheet be immersed for a few minutes in a bath of melted sulphur, maintained at a temperature of 120° C., the rubber absorbs about one-tenth of its weight of that element, and, although somewhat yellowish in colour from the presence of free sulphur, it is still unvulcanized, and unaltered as regards general properties. If, however, it be now subjected for an hour or so to a temperature of 140° C., true combination sets in, and vulcanized caoutchouc is the result. When a manufactured article has been saturated with sulphur in the melted-sulphur bath, the heat necessary for vulcanization may be obtained either by high-pressure steam, by heated glycerin, or by immersion in a sulphur-bath heated to about 140° C. In this last case absorption of the sulphur and its intimate combination with the rubber occur simultaneously. Cut sheets, or articles made from them, may be saturated by being laid in powdered sulphur maintained for some hours at about 110° C. Sheets sulphured in this way can be made up into articles and joined together either by warming the parts to be united, or by means of india-rubber solution; after which the true vulcanization, or "curing" as it is termed, can be brought about in the usual way. Another method of vulcanizing articles made from cut sheet rubber consists in exposing them to the action of chloride of sulphur. Either they are placed in a leaden cupboard into which the vapour is introduced, or they are dipped for a few seconds in a mixture of one part of chloride of sulphur and forty parts of carbon disulphide or purified light petroleum. Vulcanization takes place in this instance without the action of heat; but it is usual to subject the goods for a short time to a temperature of 40° C. after their removal from the solution, in order to drive off the liquid which has been absorbed, and to ensure a sufficient action of the chloride of sulphur. Treatment with a warm alkaline solution is afterwards advisable, in order to remove traces of hydrochloric acid generated during the process. Another very excellent method of vulcanizing cut sheet goods consists in placing them in a solution of the polysulphides of calcium at a temperature of 140° C. Rubber employed for the manufacture of cut sheets is often coloured by such pigments as vermilion, oxide of chromium,

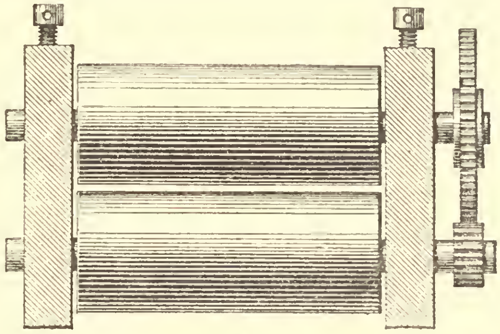

Fig. 8.—The Mixing Rollers.

ultramarine, orpiment, antimony, lamp black, or oxide of zinc, incorporation being effected either by means of the masticator or by a pair of rollers heated internally by steam, and so geared as to move in contrary directions at unequal speed (fig. 8). Most of the rubber now manufactured is not combined with sulphur when in the form of sheets, but is mechanically incorporated with about one tenth of its weight of that substance by means of the mixing rollers,—any required pigment or other matter, such as whiting or barium sulphate, being added. The mixed rubber thus obtained is readily softened by heat, and can be very easily worked into any desired form or rolled into sheets by an apparatus known as the calendering machine. Vulcanization is then ensured by exposure for half an hour or more to a temperature of 135°–150° C., usually in closed iron vessels into which high-pressure steam is admitted (fig. 9). Tubes are generally made up around mandrels, and allowed throughout the curing to remain imbedded in pulverized French chalk, which affords a useful support for many articles that tend to lose their shape during the process. Of late years a considerable amount of seamless tubing has been made, much in the same way as lead piping, by forcing the mixed rubber through a die, and curing as above. The calendered sheets are generally cured between folds of wet cloth, the markings of which they retain; and hollow articles, such as playing balls or injection bottles, are vulcanized in iron or brass moulds, tinned inside and

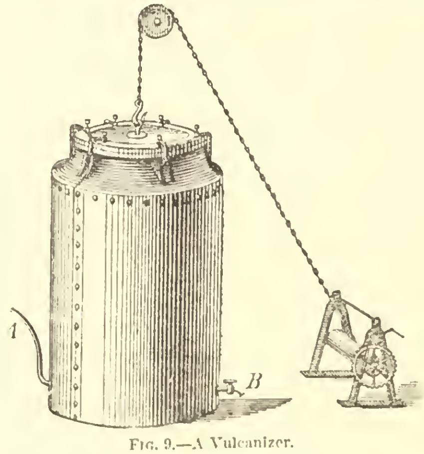

Fig. 9.—A Vulcanizer.

very slightly greased. Before it is put in, the article is roughly put together, and the expansion of the included air forces the rubber into contact with the internal surface of the mould, or a little carbonate of ammonia is enclosed. Belting intended for driving machinery is built up of canvas which has been thoroughly frictioned with the soft mixed rubber, and is cured by placing it in a kind of press kept by means of steam at a dry heat of about 140° C. Packing for the stuffing boxes of steam engines is similarly prepared from strips of rubber and frictioned canvas, as also are the so-called insertion sheets, in which layers of rubber alternate with canvas or even wire gauze. India-rubber stereotypes are now extensively made use of as hand stamps, and attempts have been made to introduce them for press and machine printing. A plaster cast of the type is, when dry, saturated with shellac varnish and redried. Rubber mixed in the usual way with about 10 per cent. of sulphur is now softened by heat, forced into the mould, and retained there by pressure during the operation of curing, which is usually effected in an iron box heated over a gas burner to 140° C.

The ordinary macintosh or waterproof cloth is prepared by spreading on the textile fabric layer after layer of india-rubber paste or solution made with benzol or coal-naphtha. If cotton or linen is used, it is usual to incorporate sulphur with the paste, and to effect vulcanization by steam heat; but, when silk or wool is employed, no sulphur is added to the paste, the dried coating of rubber being merely brought into momentary contact with the mixture of chloride of sulphur and carbon disulphide already mentioned. Double texture goods are made by uniting the rubber surfaces of two pieces of the coated material. Air goods, such as cushions, beds, gas bags, and so forth, are made of textile fabrics which have been coated with mixed rubber either by the spreading process above described, or by means of heated rollers, the curing being then effected by steam heat. The manufacture of overshoes and fishing boots is an analogous process, only the canvas base is more thickly coated with a highly pigmented rubber of low quality. The articles are first fashioned by joining the soft material; they are then varnished, and afterwards cured in ovens heated to about 135° C. The fine vulcanized "spread sheets" are made by spreading layers of india-rubber solution, already charged with the requisite proportion of sulphur, on a textile base previously prepared with a mixture of paste, glue, and treacle. Vulcanization is then effected by steam heat, and, the preparation on the cloth being softened by water, the sheet of rubber is readily removed. The required thickness of the spread sheet is very often secured by the rubber-faced surfaces of two cloths being united before curing. The threads used in making elastic webbing are usually cut from spread sheets. The manufacture of springs, valves, and washers does not require any very special notice, these articles being generally fashioned out of mixed rubber, and vulcanized either in moulds or in powdered French chalk. Rollers are made to adhere to their metal spindles by the intervention of a layer of ebonite, and after vulcanization they are turned. In order to make spongy or porous rubber, some material is incorporated which will give off gas or vapour at the vulcanizing temperature,—such as carbonate of ammonia, crystallized alum, and finely ground damp sawdust. Uncombined sulphur is injurious, and often leads to the decay of vulcanized goods; but an excess of sulphur is generally required in order to ensure perfect vulcanization. Sometimes the excess is partially removed by boiling the finished goods with a solution of caustic soda, or some other solvent of sulphur. In other cases the injurious effects of free sulphur are obviated by using instead of it a metallic sulphide,—generally the orange sulphide of antimony; but, for the best results, it is necessary that this should contain from 20 to 30 per cent. of uncombined sulphur.

When the vulcanization of rubber is carried too far—say from the presence of a very large proportion of sulphur and an unduly long action of heat, the caoutchouc becomes hard, horn-like, and often black. Rubber hardened by over-vulcanization is largely manufactured under the name of ebonite or vulcanite. It is usually made by incorporating about 40 per cent. of sulphur with purified Borneo rubber by means of the usual mixing rollers, shaping the required articles out of the mass thus obtained, and heating for six, eight, or ten hours to from 135° to 150°. Ebonite takes a fine polish, and is valuable to the electrician on account of its insulating properties, and to the chemist and photographer because vessels made of it are unaffected by most chemical reagents. A kind of vulcanite which contains a very large proportion of vermilion is used, under the name of dental rubber, for making artificial gums.

The following list of works and papers on the rubber industry enumerates the writings which are calculated to be especially useful to the enquirer:—Charles Goodyear, *Gum Elastic and its Varieties*, New Haven, U.S.A., 1853; Friedrich Harzer, *Gutta-Percha und Kautschuk, ihr Vorkommen*, &c., Weimar, 1853; Paulin Desormeaux, *Nouveau manuel complet du fabricant d'objets en caoutchouc, en gutta-percha, et en gomme factice*, 424 pp., Paris, 1855; C. H. Schmidt, *Der Fabricant von Kautschuk und Gutta-Percha Waaren*, 207 pp., Weimar, 1856; Thomas Hancock, *Origin and Progress of the Indian-Rubber Manufacture in England*, London, 1857; Heinrich Keysserling's edition of Friedrich Harzer's *Gutta-Percha und Kautschuk*, 273 pp. and atlas, Weimar, 1864; *Abridgments of Specifications relating to the Preparation of India-Rubber and Gutta-Percha*, 1791-1866, 262 pp., printed by order of the Commissioners of Patents, London, 1875; "India-Rubber and Gutta-Percha," a series of articles in the *Universal Engineer*, vol. ii., Manchester, 1879; Franz Clouth, *Die Kautschuk Industrie*, 76 pp., Weimar, 1879; T. Bolas, *Cantor Lectures on the India-Rubber and Gutta-Percha Industries*, London, 1880; M. Maigne, *Nouveau manuel complet du fabricant d'objets en caoutchouc*, &c., 2 vols., 506 pp., Paris, 1880. (T. B.)

INDICTMENT, in English law, is a formal accusation in writing, laid before a grand jury, and by them presented on oath to a court of competent jurisdiction. It is thus distinguished from a mere presentment by the grand jury made on information within their own knowledge, and from an INFORMATION (*q.v.*), by which a prosecution is instituted at the suggestion of a public officer without the intervention of a grand jury. The grand jury hears in private the witnesses in support of the application, and, if it considers that a *prima facie* case has been made out, it is its duty to find the indictment "a true bill." Otherwise it sends the indictment into court torn up, which is a finding of "no bill." In this case the indictment is said to be ignored. An indictment is said to consist of three parts—the commencement or caption, the statement of the facts constituting the crime, and the conclusion. In each part appropriate and highly technical language is still used, but verbal precision is not so essential as it once was, and departure from the ordinary formalities, if it involves no misapprehension or mistake, does not make a flaw in the indictment. The formal commencement of an indictment is after the following style:—"Middlesex to wit. The jurors for our lady the Queen on their oath present," &c. The name of the county and district in the margin is the "venue," and it should in general be the county in which the offence was committed, or the district over which the jurisdiction of the court extends. An indictment concludes with the words "against the peace of our lady the Queen, her crown and dignity," if the offence is a crime at common law. If the offence is a crime by statute, the indictment must also use the words "against the form of the statute in such case made and provided." In the "statement" great care must be taken to set forth the facts of the case with certainty and precision. It may be mentioned that in the Criminal Code Bill, which has been drafted on behalf of the crown by Mr Justice Stephen, and revised by a judicial commission, it is proposed to substitute for the existing formalities a simple statement of particulars, with a reference to the section of the code defining the offence. An indictment lies "for all treasons and felonies, for misprision of treasons and felonies, and for all misdemeanours of a public nature at common law." And if a statute prohibit a matter of public grievance, or command a matter of public convenience, all acts or omissions to the contrary, being misdemeanours at common law, are punishable by indictment if no other mode of proceeding is pointed out by the statute. The statement of the offence is called a count, and an indictment may consist of several counts. But only one offence ought to be charged in each count, and offences of a different nature, *e.g.*, murder and burglary, should not be charged in the same indictment. Until recently it was thought improper to charge theft in one count and receiving in another of the same indictment; but that is now made possible by statute. So a prisoner may be charged as accessory before the fact in one count, and as accessory after the fact in another. At common law an indictment may be preferred at any time after the offence committed; but various periods of limitation have been fixed by statute in special cases. For example, certain kinds of treason must be prosecuted within three years.

Prosecutions by indictment in the United States generally resemble those of English law, the offence being charged as "against the peace and dignity of the state or commonwealth," unless it is a statutory offence, when the conclusion "against the statute," &c., is used.

INDIGO is a well known and exceedingly valuable blue dyeing material. The substance has been known among Western communities from an early period, being mentioned by Dioscorides as Ἰνδικόν, and by Pliny as *Indicum*; when it made its appearance in England it was called indico. As all these names show, the material in its origin and production is closely related to India, among the commercial commodities of which it has always occupied a distinctive and important place. It was not, however, till after the establishment of the Cape route to India that indigo came to be largely used in the dyeing establishments of Western Europe, woad having in earlier times been utilized for purposes to which indigo was subsequently applied.

As a commercial substance indigo is entirely obtained from the vegetable kingdom, although it may be produced, in minute quantity, from a principle contained in urine, and its synthetical formation has also been accomplished. The number of plants from which indigo may be procured is known to be large, but only from a very few is it prepared in practice. These are various species of the leguminous genus *Indigofera*, especially the four species *I. tinctoria*, *I. Anil*, *I. disperma*, and *I. argentea*; and it is said that in China *Polygonum tinctorium* and other non-leguminous plants are used as the source of *lan* or Chinese indigo. The woad plant, *Isatis tinctoria*, owes its value as a dye to the presence of indigo matter, although indigo is not actually prepared from it. The most important source of indigo, and that most generally cultivated, is *I. tinctoria*, which is an herbaceous plant growing 3 to 5 feet high, and having bipinnate leaves. It is in the leaves that the indigo-yielding principle chiefly resides, and these are most gorged with it at the period when the flower-buds are about to open. It is then that the plant is cut down; and in some regions the same stock yields in one year a second and even a third crop of stems.

Two principal methods of preparing indigo are pursued, —dried leaves being operated on in the one, while the fresh green stalks and leaves are used in the other. It will be sufficient to describe the latter, the more important process, as it is conducted in Bengal, where the most highly esteemed varieties of indigo are made. The cut leaves and stems are tied up into small bundles and conveyed at once to the factory, in which there are two ranges of large tanks or vats, one series being at a lower level than the other. In the upper or fermenting vats the bundles are submerged; and cross-bars are fixed over the vats. A fermentation more or less rapid ensues, its completion occupying, according to the temperature, from nine to fourteen hours. The progress of the operation is judged by the tint assumed by the water, which under favourable conditions should at the end of this stage be of a fine clear yellow colour. In this condition the liquid is run off into the lower vats, in which it is necessary to maintain it in a state of violent agitation. For this purpose a number of men, armed with long bamboos, enter the vats and lash the water incessantly for two or three hours, thus constantly exposing new surfaces to the air. Gradually the liquid assumes a green colour, and indigo appears in broadish flakes, which as it forms begin to sink. After this transformation is complete, the liquid is allowed to settle, and as the indigo sinks the clear liquid is drawn off in a series of discharges by pipes at different heights in the vat. The deposit of indigo is then placed in a boiler, and, to prevent any further fermentation, is raised to the boiling point. After resting for about a day, it is boiled for three or four hours, and then filtered over a thick filtering cloth, and the paste is dried by pressure. The cakes formed during the pressing are then put away to dry gently in the shade, and in a few days are ready for packing.

Bengal indigo of good quality forms a porous earthy mass, light and easily pulverized; and when newly fractured it has that brilliant purple-blue colour distinctively known as indigo, with a kind of coppery lustre. Experts distinguish upwards of forty qualities of Bengal indigo, principally characterized by varying shades of colour,—the inferior qualities being dull in hue, with greenish or greyish tones, hard, dense, and not readily broken. The varieties of indigo which come into the European markets are classified according to their sources: the classes most frequently met with are Bengal, Oude, Madras, Manila, Java, Egypt, Guatemala, Caraccas, Mexico, and Brazil. The best qualities are the Bengal, Java, and Guatemala.

The condition in which the indigo-yielding principle exists in the fresh plants has been a subject of some speculation and controversy. Dr Schunck has investigated the leaves of the woad (*Isatis tinctoria*), the Chinese indigo-plant (*Polygonum tinctorium*), and others, and from all these has isolated a glucoside body indican, which, under the influence of dilute mineral acids, is decomposed, forming indigotin or indigo-blue and a variety of glucose which he calls indiglucin. It has been assumed that the same principle resides in *Indigofera* as in these other plants, and is the efficient source of the dye-stuff from that genus. In the decomposition of indican there are formed—in addition to indigo-blue—indigo-red (indigo-rubin or indigo-purpurin) isomeric with the blue, indigo-brown, and indigo-gluten, all of which, forming part of the precipitate, modify the colour of the product, and render commercial indigo a compound body. Indigo also contains a certain amount of inorganic matter and other non-tinctorial constituents, so that the proportion of indigo-blue may vary from about 72 down to 12 or 14 per cent. of the mass. Pure indigo-blue or indigotin, $C_{16}H_{10}N_2O_2$, is a neutral body of a deep blue colour, destitute of taste and odour, and insoluble in water, dilute acids, and alkalies, and in cold alcohol and ether. Boiling alcohol, ether, and aniline dissolve it, as do also petroleum, benzene, chloroform, and phenol, melted spermaceti and stearic acid, and several oils. It sublimes at

290°–300° C., giving off violet vapours which condense into right rhomboidal prisms possessing a brilliant coppery lustre. By destructive distillation, indigotin yields, among other products, aniline,—a circumstance to which that now well-known body owes its name (from the Sanskrit *nili* through the Portuguese *anil*, indigo). Treated with oxidizing agents, indigotin takes up oxygen, and is converted into isatin, thus :—

$$\underset{\text{Indigotin.}}{C_{16}H_{10}N_2O_2} + 2O = \underset{\text{Isatin.}}{C_{16}H_{10}N_2O_4} \;;$$

and by further oxidation nitro-salicylic acid and picric acid are evolved. The most valuable character, however, of indigotin is found in its behaviour under the influence of hydrogenizing or reducing agents. In the presence of nascent hydrogen indigotin absorbs that element and is converted into white indigo, a colourless body which is readily soluble in alkaline or earthy alkaline solutions, and by simple exposure to the air re-oxidizes and reverts to its original blue condition indigotin. The reduction to white indigo is thus formulated :—

$$C_{16}H_{10}N_2O_2 + 2H = C_{16}H_{12}N_2O_2 .$$

Advantage is taken of these properties in dyeing with indigo as detailed under DYEING, vol vii. pp. 576–7. See also CALICO-PRINTING, vol. iv. pp. 689–90.

Indigo when dissolved in strong sulphuric acid, forms with it two acid compounds, both of which have limited industrial applications. These are (1) sulphindigotic acid, $C_{16}H_8N_2O_4(SO_3H)_2$, known also as sulphate of indigo or soluble blue indigo, and (2) sulphophœnicic acid, sulphopurpuric acid, or indigo purple, $C_{16}H_9N_2O_2(SO_3H)$. These bodies are formed together in the sulphuric acid solution of indigo ; but, as the second is insoluble in weak acids, it precipitates when the solution in which it is formed is largely diluted with water. Both these acids are soluble in water. The first was formerly used in dyeing Saxon-blue on wool and silk, a style now little known ; and the sodium salt of the second is known as red indigo carmine.

The synthetical preparation of indigo is a subject which has long occupied the attention of chemists, as obviously any means by which the substance might be artificially obtained on a commercial scale could not fail to be of great industrial value. The numerous efforts made in this direction appear at last (1881) to be crowned with success ; and there is now little doubt that artificial indigo will soon become a commercial product. It is to Professor Adolf Baeyer of Munich that the measure of success already attained in manufacturing indigo is due. For many years he has patiently investigated the molecular constitution of indigotin and its derivatives. From isatin, prepared by the oxidation of indigotin, Baeyer and Knob produced successively di-oxindol, $C_{16}H_{14}N_2O_4$, oxindol, $C_{16}H_{14}N_2O_2$, and indol, $C_{16}H_{14}N_2$. Baeyer at a later period, with the assistance of Emmerling, succeeded in producing indol from cinnamic acid, and as that body can be prepared from coal-tar a new connecting chain was established between indigo at one extreme and coal-tar at the other, meeting in indol just as at a much earlier date they had similarly met in aniline. The task remained of reconverting these derivatives of indigotin into that body, and towards that, in 1870, Baeyer and Emmerling, by heating isatin with phosphorus trichloride, acetyl chloride, and phosphorus, succeeded in obtaining a mixture of indigotin and indigo-rubin. In 1878 the further steps necessary to complete the cycle were accomplished by Baeyer, when from phenyl-acetic acid he prepared oxindol. Acting on oxindol by nitrous acid he produced nitrosoxindol, which in its turn, by treatment with nascent hydrogen, was transformed into amidoxindol, a body which on oxidation yielded isatin. Thus the series of transformations was complete ; but they were effected by a process so roundabout and elaborate as to preclude all hope of any commercial issue from the method. Quite recently Baeyer, coming back to the use of cinnamic acid, has devised the much simpler and more direct process which now promises to become, and indeed already is in operation as, a method for the commercial preparation of indigo. By treating cinnamic acid with nitric acid, ortho-nitro-cinnamic acid is prepared, which on exposure to bromine vapour readily combines with that body, forming ortho-nitro-dibrom-hydro-cinnamic acid. This substance when treated with caustic alkali is converted by the loss of the bromine into ortho-nitro-phenyl-propiolic acid, which, lastly, when heated in an alkaline solution of grape sugar develops into indigotin. The steps in the process are therefore represented thus :—

$$(1)\quad \underset{\text{Cinnamic acid.}}{C_6H_5C_2H_2COOH} + \underset{\text{Nitric acid.}}{NO_2HO} = \underset{\text{Nitro-cinnamic acid.}}{C_6H_4(NO_2)C_2H_2COOH} + \underset{\text{Water.}}{H_2O} .$$

$$(2)\quad \underset{\text{Nitro-cinnamic acid.}}{C_6H_4(NO_2)C_2H_2COOH} + \underset{\text{Bromine.}}{2Br} = \underset{\text{Nitro-dibrom-cinnamic acid.}}{C_6H_4(NO_2)C_2H_2Br_2COOH} .$$

$$(3)\quad C_6H_4(NO_2)C_2H_2Br_2COOH + \underset{\text{Caustic soda.}}{2NaOH} = \underset{\text{Nitro-propiolic acid.}}{C_6H_4(NO_2)C_2COOH} + 2NaBr + 2H_2O .$$

$$(4)\quad \underset{\text{Nitro-propiolic acid.}}{2C_9H_5NO_4} + 2H_2 = \underset{\text{Indigotin.}}{C_{16}H_{10}N_2O_2} + 2CO_2 + 2H_2O .$$

The nitro-propiolic acid is now being manufactured by the Badische Anilinfabrik as a material for indigo printing. The acid has simply to be printed on the cloth with a thickening containing grape sugar and alkali, and, by steaming, indigo is developed in the fibre. This reaction is in itself a matter of no small importance, seeing that the printing of indigo direct is an extremely troublesome operation. Hitherto indigo in mass has not been produced, but there can be little doubt that the remaining difficulties, among which is the present expensiveness of cinnamic acid, will soon be overcome, and that artificial indigo will take its place among ordinary chemical manufactures. (J. PA.)

INDIUM, a metal discovered with the aid of the spectroscope in 1863 by Reich and Richter when testing certain specimens of Freiberg zinc-blende for thallium. Instead of the brilliant green line characteristic of this latter metal, they observed an intense indigo-blue line occupying a position different from that of any known line, and were thus at once led to suspect the presence of a previously unknown element. The name indium was chosen for the metal, when they succeeded in isolating it, on account of this circumstance. It has since been detected in blendes from various sources, but always in extremely minute amount, and still remains one of the rarest of the elements. Indium is best prepared from crude zinc made from indium-containing blendes. As it is less positive than zinc, if the crude zinc is treated with insufficient hydrochloric acid to dissolve it completely, a residue is obtained containing all the indium together with several other metals also present in small quantity in the zinc. The properties of indium have already been partially described (vol. v. p. 533). Its flame-spectrum exhibits, besides the indigo-blue line (w. l. 4509), a violet line of w. l. 4101. Lockyer has stated (*Royal Society Proceedings*, 1878, xxviii. p. 177) that the strongest line in photographs of the spectrum of indium in the electric arc is, as already recorded by Thalén, the *h* line of hydrogen, the hydrogen line near G being, however, absent. He argues that this is not to be explained by the supposition that the indium contains occluded hydrogen, since none of the hydrogen lines become impressed on the plate when palladium-hydrogen is volatilized in the arc. Indium is commonly regarded as closely allied to aluminium, on account of the general resemblance of corresponding compounds of the two metals, and especially on account of the existence of an indium alum isomorphous with ordinary alum. Hence indium chloride is usually represented by the formula In_2Cl_6, the formula of aluminium chloride being Al_2Cl_6. V. and C. Meyer have recently found, however, that the density of its vapour at a bright red heat corresponds with the formula $InCl_3$, indicating that indium is a *triad* and not a *tetrad* like aluminium and iron. Aluminium and iron (ferric) chloride boil readily at a temperature below that at which sulphur or mercury boil, but indium chloride does not volatilize in the vapour of perchlorodiphenyl, which boils considerably above 440° C., and only slowly sublimes in the vapour of phosphorus pentasulphide (b.p. 530°). It evaporates by no means rapidly at a dull red heat, but is momentarily converted into vapour at a bright red heat, furnishing a gas which behaves normally. It is noteworthy that aluminium chloride decomposes entirely at a temperature very little above that at which it gasifies. The issue raised by the Meyers' observation is of considerable theoretical interest, and the subject demands further investigation.

INDORE, or the Territories of the Mahárájá of Holkar, is one of the principal native states in India, under the Central India Agency. The name of the state is taken from that of the capital Indore, 22° 42′ N. lat., 75° 54′ E. long. The territory consists of many isolated tracts; but since 1861 arrangements have been made to concentrate the state as much as possible, and lands which were formerly held by Holkar in Ahmednagar district and in the Deccan have been exchanged for districts and *párgánás* bordering on the Nerbudda (Narbadá) river and the tract in which Indore town is situated. The area of the whole of Holkar's territories is estimated at 8075 square miles. Of these districts, those situated to the north are drained by the river Chambal and its feeders, those to the south by the Nerbudda. The tracts are fertile, producing in abundance excellent wheat and other grains, pulse, sugar-cane, cotton, and opium. The poppy is so generally cultivated that, when in bloom, it gives the country the appearance of a vast garden. Tobacco is also grown to a great extent, and is of admirable quality.

The great Vindhyá range traverses the southern division of Holkar's dominions, in a direction from east to west, a small portion of the territory lying to the north of the mountains, but by much the larger part to the south. The latter is a portion of the valley of the Nerbudda, and is bounded on the south by the Sátpura mountains. Basalt and other volcanic formations predominate in both ranges, although there is also much sandstone. The Nerbudda traverses Indore from east to west; and the valley at Mandlesar, in the central part of the district, is between 600 and 700 feet above the sea. The general appearance of the country is that of an undulating valley intersected by low rocky ranges, in some parts thickly clothed with stunted jungle, which also covers considerable tracts in the plains. The forests of the state form two belts, the southern and the northern. The former, which is considered unhealthy, borders on the Sátpura range, and the latter, a healthy tract, on the Vindhyá hills. From its inter-tropical position, the climate of Indore is sultry, the thermometer ranging from 60° to 90° Fahr. in the house. For some months from the close of the periodical rains, malaria is so deadly in the jungles that no European ventures into them.

Besides the ruling tribe of Marhattás, the population comprises many other classes of Hindus, a few Mahometans, and a considerable number of Gonds and Bhíls. The Vindhyá and Sátpura ranges are peculiarly the country of the Bhíls, who are considered to have been the earliest occupiers of the soil. This race is one of the wildest in India, its people living for the most part on vegetables and game, or on the plunder of their more civilized neighbours. They have, however, of late years been brought into more peaceful habits of life. The population of Holkar's territories was estimated in 1875 at 635,450. The revenue in 1875–76 amounted to £459,800, and the disbursements to £405,100. The number of schools in 1876 was 77, attended by 3235 pupils, costing the state £3000. The principal educational establishment is the Rájkumár college, for the education of the sons of the chiefs and nobles of Central India. The institution is maintained by the British Government, and is located within the grounds assigned for the purposes of the "Residency." The governor-general's agent for Central India has his headquarters at Indore town. A branch line from the Great Indian Peninsula Railway, known as the Holkar State Railway, runs from Khandwa junction to Indore. The principal engineering works are the ascent of the Vindhyá range and the bridge over the Nerbudda river. From Indore the line is taken up by the Neemuch Railway through part of Sindhia's dominions, connecting Indore with Nasírábád, and finally with Delhi and Agra. The chief means of communication are the Bombay and Agra Trunk Road, which runs through Indore, with branches at Mhow and Dhar, &c.; another road, 80 miles in length, joins Indore with Khandwa, crossing the Nerbudda by ferry.

There are cotton mills at work in the state, which have proved a regular source of income, as they turn out cloth for which there is a ready market. In 1878 the number of spindles was 10,000. Indore city contains a charitable and leper's hospital, and a dispensary. Cholera frequently prevails.

History.—The founder of this dynasty was Malhar Ráo, the son of a shepherd, who lived in the village of Hol, in the Deccan, whence he derived the surname of Holkar, the adjunct "kae," "kar," or "kur" signifying inhabitant. Disdaining his father's occupation, he enlisted in a troop of horse; his rise was rapid, and he eventually became one of the most distinguished leaders in the first Marhattá invasion of northern India, and obtained many possessions north of the Nerbudda and about Indore by grant from the peshwá. At his death he was succeeded by his grandson Malli Ráo, who died shortly after his accession. Alia Bái, the mother of Malli Ráo, then took the management of affairs, and appointed as commander of her army Malhar Túkaji Holkar, a chief of the same tribe as, but in no way related to, Malhar Ráo. Alia Bái died in 1795, and was not long survived by Túkaji Ráo, after whose death the power of the house of Holkar was nearly extinguished by family quarrels and the dissensions which distracted the Marhatta confederacy at the close of the last century. The fortunes of the family were, however, restored by Jeswant Ráo, an illegitimate son of Túkaji Holkar, who, after a signal reverse from the army of Sindhia, employed European officers to introduce their discipline into his army, and in 1802 defeated the united forces of Sindhia and the peshwa at the battle of Poona. Twice Holkar attacked British territory, but was totally routed, and finally was forced to sign a treaty on the banks of the Biás, by which he was stripped of many of his conquests. He died insane in 1811, and was succeeded by his son Malhar Ráo, during whose minority the state was torn by the most violent dissensions, and overrun by Pindáris. The army mutinied, and British intervention became necessary to restore the government. Malhar Ráo dying in 1833 without issue, his wife and mother adopted Martand Ráo Holkar as his successor. He was summarily deposed by Harí Ráo, a cousin of Malhar Ráo, whose accession was welcomed by the troops. His rule was a tissue of intrigue and disorder. He died in 1843, and his adopted son, who succeeded him, died in a few months, leaving no heir. The succession was declared to rest with the British Government, and Túkaji Ráo (the present maháráj), at that time eleven years old, was selected and placed on the *gadi*. Holkar maintains a military establishment of 3100 regular and 2150 irregular infantry, 2100 regular and 1200 irregular cavalry, and 340 artillerymen, with 24 field guns equipped.

INDRE, a department of central France, consisting of parts of the old provinces Bas-Berry, Orléanais, and Marche, is bounded N. by the departments of Indre-et-Loire and Loir-et-Cher, E. by Cher, S. by Creuse, Haute-Vienne, and Vienne, and W. by Vienne and Indre-et-Loire. It lies between 46° 22′ and 47° 15′ N. lat., and between 0° 52′ and 2° 13′ E. long., being 60 miles in length from north to south and 54 miles in breadth from east to west. It derives its name from the river Indre, which flows through it from south-east to north-west. The Creuse, Claise, and Vienne, tributaries, like the Indre, of the Loire, are the other principal streams. The surface forms a vast plateau, sloping from south to north, and divided into three districts, the Bois-Chaud, Champagne, and Brenne, varying with the characteristics of the soil. The Bois-Chaud is a large well-wooded plain, comprising seven-tenths of the entire area, and covered with a sandy and stony soil. In the river valleys, however, the soil is extremely fertile. The Champagne, a bare though fertile district to the north-west, produces abundant cereal crops, and affords excellent pasturage for large numbers of sheep, celebrated for the fineness of their wool. The Brenne is an unhealthy marshy district to the south. The climate of Indre is mild and temperate, though moist. On the southern heights the cold is often severe, and throughout the department the crops suffer much from hailstorms. The growth of cereals in Indre exceeds the requirements of the inhabitants; the pasturage is good and abundant; and there are numerous valuable forests of oak, elm, beech, and other timber. Fruit-trees are plentiful, and market-gardening is a flourishing industry. The vine is cultivated to a small extent, and yields a mediocre red wine. Chestnuts, potatoes, turnips, beetroot, hemp, and colza are also grown. The rearing of horses and horned cattle is carried on in the Bois-Chaud, and of sheep in the Champagne. The mineral resources of the department include large quantities of iron, besides marl, sandstone, limestone, marble, lithographic and mill-stones, granite, and other stones. The chief industry is the working of the iron; tobacco, paper, parchment, cloth, woollen goods, leather, felt, pottery, porcelain, bonnets, scythes, and tiles are also manufactured. Indre has considerable trade in its natural productions and manufactured articles, and in wool, horses, and oxen. The department is divided into the arrondissements of Châteauroux, Le Blanc, La Châtre, and Issoudun, with 23 cantons and 245 communes. The chief town is Châteauroux. The total area is 2624 square miles, and the population in 1866 was 277,860, and in 1876 281,248.

INDRE-ET-LOIRE, a department of central France, consisting of parts of the old provinces Touraine, Orléanais, Anjou, and Marche, is bounded N. by the departments of Sarthe and Loir-et-Cher, E. by Loir-et-Cher and Indre, S. and S.W. by Vienne, and W. by Maine-et-Loire. It lies between 46° 45′ and 47° 43′ N. lat., and between 0° 4′ and 1° 18′ E. long., being 70 miles in length from north to south and 59 in breadth from east to west. It derives its name from the Loire and its tributary the Indre, which flow through it. The other chief affluents of the Loire in the department are the Loir, Cher, and Vienne. Indre-et-Loire is generally level, and conveniently divides itself into the following districts, according to the characteristics of the soil: the Gâtine, a flat sterile region to the north of the Loire, with some forests; the Varenne, a rich and fertile district between the Loire and Cher; the Champeigne, a chain of vine-clad slopes, separating the valleys of the Cher and Indre; the Véron, between the Loire and Vienne, the most highly cultivated district, but subject to inundation by the former river; the plateaus of Sainte-Maure, a bare hilly region, the most unproductive of the department; and the Brenne, between the Claise and Creuse, forming part of the marshy territory which extends under the same name into Indre. The valley of the Loire in this department, from its beauty and fertility, receives the name of the Garden of France. The climate of Indre-et-Loire is singularly agreeable and equable, avoiding extremes of both heat and cold. About two-thirds of the entire area is suited for cultivation, but the south far exceeds the north in fertility. Cereals of all kinds are grown in greater abundance than is required by the inhabitants. Vines are cultivated to a considerable extent, and yield excellent white and red wines, exported chiefly to Holland and Belgium. Vegetables, potatoes, fruits (plums especially being cultivated for the trade in *pruneaux de Tours*), hemp, liquorice, coriander, anise, truffles, walnuts, and mulberries are also produced. Owing to the deficiency of well-watered pasture, domestic animals are few. Agriculture has been for some time in a backward state, from the conservative adherence to old systems and implements by the small peasant proprietors, who hold much of the land. The mineral resources of the department are unimportant. Iron, marble, limestone, millstone, lithographic stone, and various kinds of marl are worked. Copper, though found, is not worked. The presence of clay, suitable for bricks and pottery, has encouraged the manufacture of these articles. The chief industry is the manufacture of gunpowder at Ripaut near Tours. Silk-weaving, formerly very flourishing, is again beginning to revive. The refining of beetroot sugar and the preserving of fruits occupy many hands. Cloth, carpets, files, woollen goods, paper, and basket work are made in the department; and there is a considerble trade in many of the manufactured articles. Indre-et-Loire is divided into the arrondissements of Tours, Loches, and Chinon, with 24 cantons and 282 communes. The chief town is Tours. The total area is 2360 square miles, and the population in 1866 was 325,193, and in 1876 324,875

INDULGENCE, in Roman Catholic theology, is defined as the remission, in whole or in part, by ecclesiastical authority, to the penitent sinner, of the temporal punishment due for sin.[1] The word (from *indulgeo*, and perhaps connected with *dulcis*) in its classical use has the meaning which it still bears in ordinary parlance; but by post-classical writers it is often employed in a more special sense to denote a remission of taxation or of punishment. The *Codex Theodosianus* has two titles "De indulgentiis debitorum" (lib. xi. tit. 28) and "De indulgentiis criminum" (lib. ix. tit. 38). In this sense it was taken up by ecclesiastical writers; thus Ambrose says "nemo recte egerit pœnitentiam nisi a Deo per Christum speraverit indulgentiam;" and Augustine (*Con. Jul.*, i. 3) quotes Reticius of Autun (313 A.D.) to the effect that "baptism is the principal indulgence known to the church." The natural and actual synonyms of the word are "gratia," "venia," "relaxatio," and "remissio."

The penitential discipline of the ancient church was very severe in its treatment of a large class of scandalous offences; and in the canonical punishments or penances (which from a very early date began to be determined with considerable precision) time was always a prominent element. But a certain power of showing leniency (φιλανθρωπία) or the

[1] "Est autem indulgentia remissio pœnæ temporalis adhuc post absolutionem sacramentalem peccatis debitæ, in foro interno coram Deo valida, facta per applicationem thesauri ecclesiæ a superiore legitimo" (Perrone, *Præl. Theol.*, "Tract. de Indulg.," proœm.).

reverse, in the way of shortening or lengthening the prescribed duration of the period during which ecclesiastical penance was to be done, was always left to the discretion of the bishop. An early and explicit proof of this is found in the fifth canon of the council of Ancyra (314).[1] This discretionary leniency was sometimes, as appears from the writings of Cyprian, granted by the bishop on the intercession of those who were witnessing for the truth in prison; sometimes also at the instance of the civil magistrate. The episcopal power was occasionally exercised, not only in a shortening of the canonical duration of the penance, but in some mitigation of the nature of the penalty itself (Syn. Ancyr., can. 2). We find indications at a very early period that some of the minor ecclesiastical offences could be readily and canonically atoned for by almsgiving (Aug., *De Fid. et. Op.*, c. 19); thus gradually arose, by steps which can readily be conjectured, a regular system of commutations (redemtiones, commutationes), set forth in "libri penitentiales," offering striking analogies to the provisions made by the various criminal codes by which the Theodosian was supplanted throughout Europe. In the *Penitential* of the Greek Theodore of Canterbury, for example (690), which is to be found in Migne's *Patrologia*, a canonical fast of days, weeks, or years may be redeemed by saying a proportionable number of psalms, or by paying an adequate fine. For more than four centuries this work held a position of great authority all over Europe. At the time of the crusades, to go to Palestine and take part in the struggle against the infidel was held to be a work of such extraordinary merit as to render unnecessary any other penitential act on the part of the sinner who engaged in it. Thus at the council of Clermont, held under Urban II. (1095), it was decreed "iter illud pro omni pœnitentia reputetur." The great schoolmen were the first to reduce to a theory the praxis which had gradually thus sprung up within the Western Church. That theory may be said to resolve itself into the two positions—(1) that, after the remission of the eternal punishment due for sin, there remains due to the justice of God a certain amount of temporal pain to be undergone, either before death in this world, or after death in purgatory; (2) that this pain may be remitted by the application of the superabundant merits of Christ and of the saints out of the treasury of the church, the administration of which treasury is the prerogative of the hierarchy. A characteristically elaborate statement and defence of these theses will be found in the supplement to the *Summa* of Thomas Aquinas (p. 3, qu. 25) and in the *Summa* of Alexander Halesius (p. 4, qu. 23, art. 2, membr. 5). In their Tridentine form they occur in sess. 6, can. 30, and sess. 14, can. 12–14. With these passages must be compared the condemnation of the synod of Pistoia by Pius VI. in 1794.

Indulgences are either general or particular, *i.e.*, either open to the whole church or confined to particular localities. The most general of all is that which is proclaimed in the year of jubilee. Indulgences again are either plenary or non-plenary, the former being a total remission of all the temporal punishment which may have been incurred by the recipient. It must carefully be borne in mind that, in Roman Catholic orthodoxy, indulgence is never absolutely gratuitous, and that those only can in any circumstances validly receive it who are in full communion with the church, and have resorted to the sacrament of penance, in which alone, after due contrition and confession, provision is made for the remission of the graver penalty of sin. The doctrine of indulgences, however, is singularly open to misunderstanding; and in its practical applications it has too often been used to sanction the most flagrant immorality. The scandalous abuses connected with the "pardoner's" trade, and in particular the reckless conduct of the hawkers of the papal indulgence granted to those who should contribute funds for the completion of St Peter's, Rome, were, as is well known, very prominent among the proximate causes of the Protestant Reformation. In the 14th article of the Church of England the doctrine of the "thesaurus meritorum" or "thesaurus supererogationis perfectorum" is by implication rejected; and in art. 22 "the Romish doctrine concerning purgatory and pardons" is expressly condemned. It is hardly necessary to add that "the power of the keys" is inseparable from the idea of a church, and that in this power is plainly involved a certain discretion as to the time and manner in which discipline shall be administered. This discretion is claimed by every organized body of Christians.

INDUS, one of the three greatest rivers of northern India, rises in unknown regions on the northern slopes of the sacred Kailas Mountain in the Himálayas. On the south of this same hill rises the Sutlej, the great feeder of the Indus, which unites with it after a separate course of about 1000 miles. The Indus rises in 32° N. lat. and 81° E. long., enters the Punjab in 34° 25′ N. lat. and 72° 51′ E. long., leaves the Punjab in 28° 27′ N. lat. and 69° 47′ E. long., enters Sind in 28° 26′ N. lat. and 69° 47′ E. long., and finally falls into the Arabian Sea in 23° 58′ N. lat. and 67° 30′ E. long. The basin of the Indus is estimated at 372,700 square miles, and its total length at a little over 1800 miles.

The first third of its course lies outside of British territory. It at first flows north-west for about 160 miles under the name of "Sinh-ka-bab," until it receives the Gar. Shortly after this junction it enters Kashmír. Near Iskardoh in Little Tibet is the wonderful gorge by which the river bursts through the western ranges of the Himálayas, said to be 14,000 feet in depth. For about 120 miles the river passes south-west through the wilds of Kohistán until it reaches the Punjab frontier near Derbend. A little way above Attock, in Rawál Pindí district, it receives the Cabul river, which brings down to it the waters from Afghánistán *via* Jalálábád and the Khyber Pass. The two rivers have about the same volume; both are very swift, and are broken up with rocks. Their junction during floods is a scene of wild confusion of waters. At Attock the river has fallen from its elevation of 16,000 feet at its source in Tibet to under 2000 feet. After leaving Attock, the Indus flows almost due south down the western side of the Punjab, parallel to the Suláimán hills. Just above Mithankot, in the south of the Derá Ghází Khán district, the Indus receives the accumulated waters of the Punjab. Between the Indus and the Jumna (Jamuná) flow the five great streams from which the Punjab (Panj-áb, literally "The land of the five rivers") takes its name. These are the Jhelum, the Chenáb, the Rávi, the Biás, and the Sutlej. After various junctions these rivers all unite to form the Panjnad, literally "The five rivers." The Panjnad marks for a short space the boundary between the Punjab and Baháwalpur, and unites with the Indus near Mithankot, about 490 miles from the sea. The breadth of the Indus above the confluence is about 600 yards, its velocity 5 miles an hour, its depth from 12 to 15 feet, and its estimated discharge 91,719 cubic feet per second. The breadth of the Panjnad above the point of junction is 1076 yards, with a depth of 12 to 15 feet, but a velocity of only 2 miles an hour. Its estimated discharge is 68,955 cubic feet per second.

Below the junction the united stream, under the name of the Indus, has a breadth which varies from 2000 yards to several miles, according to the season of the year. The whole course of the river through the Punjab is broken up by islands and sandbanks. The Indus enters Sind in 28° 26′ N. lat. and 69° 47′ E. long., and empties itself by many mouths into the Arabian Sea, after a generally south-westerly course in this province of 580 miles. Its average width during the low season is 680 yards; its depth varies from 4 to 24 feet. Its velocity in the freshes averages 7 knots per hour, at ordinary times 3 knots. The discharge per second varies at the two periods from 446,086 cubic feet to 40,857. The average temperature is 10° lower than that of the air.

The delta of the Indus covers an area of about 3000 square miles, and extends along the coast-line for 125 miles. It is almost a perfect level, and nearly destitute of timber, the tamarisk and mangrove alone supplying fuel. In the marshy portions good pasturage is obtained, and in the drier rice grows luxuriantly. The climate of the delta is cool and bracing in the "winter" months, excessively hot in the "summer," and most healthy during the floods.

The Indus begins to rise in March, attains its maximum depth and width in August, and subsides in September. The registered rise at Gidu-Bandar is 15 feet. Fish abound,—at the mouths, the salt-water varieties, notably the *Clupea neowhii*, a species of herring; the chief of the freshwater varieties is the *pala*. The local consumption and export of the dried *pala* are both very large. The boats of the Indus are the *dúndhi* and *zaurak* (cargo boats), the *kauntál* or ferry-boats, and the *dúndo* or fishing boats. The aggregate burthen of the native craft on the river in 1861–62 was as follows:—up-stream to Sukkur 20,232 tons, and beyond that town 16,317; down-stream to Sukkur 7694 tons, and beyond it 11,456. In 1874 the number of steamers plying was fourteen, and of barges forty-three, with an aggregate burthen of 10,641 tons; the receipts amounted to £83,370.
