2523	Cubic Measure	
2523	Dry and Liquid Measure	
2523	Measures of Weight	

THERMAL ENERGY OR HEAT

Thermometer Scales.—There are two thermometer scales in general use: the Fahrenheit (F), which is used in the United States and in other countries still using the English system of units, and the Celsius (C) or Centigrade used throughout the rest of the world.

In the Fahrenheit thermometer, the freezing point of water is marked at 32 degrees on the scale and the boiling point, at atmospheric pressure, at 212 degrees. The distance between these two points is divided into 180 degrees. On the Celsius scale, the freezing point of water is at 0 degrees and the boiling point at 100 degrees. The following formulas may be used for converting temperatures given on any one of the scales to the other scale:

$$\text{Degrees Fahrenheit} = \frac{9 \times \text{degrees C}}{5} + 32$$

$$\text{Degrees Celsius} = \frac{5 \times (\text{degrees F} - 32)}{9}$$

Tables on the pages that follow can be used to convert degrees Celsius into degrees Fahrenheit or vice versa. In the event that the conversions are not covered in the tables, use those applicable portions of the formulas given above for converting.

Absolute Temperature and Absolute Zero.—A point has been determined on the thermometer scale, by theoretical considerations, that is called the absolute zero and beyond which a further decrease in temperature is inconceivable. This point is located at -273.2 degrees Celsius or -459.7 degrees F. A temperature reckoned from this point, instead of from the zero on the ordinary thermometers, is called absolute temperature. Absolute temperature in degrees C is known as "degrees Kelvin" or the "Kelvin scale" (K) and absolute temperature in degrees F is known as "degrees Rankine" or the "Rankine scale" (R).

$$\text{Degrees Kelvin} = \text{degrees C} + 273.2$$

$$\text{Degrees Rankine} = \text{degrees F} + 459.7$$

Measures of the Quantity of Thermal Energy.—The unit of quantity of thermal energy used in the United States is the British thermal unit, which is the quantity of heat or thermal energy required to raise the temperature of one pound of pure water one degree F. (American National Standard abbreviation, Btu; conventional British symbol, B.Th.U.) The French thermal unit, or *kilogram calorie*, is the quantity of heat or thermal energy required to raise the temperature of one kilogram of pure water one degree C. One kilogram calorie = 3.968 British thermal units = 1000 gram calories. The number of foot-pounds of mechanical energy equivalent to one British thermal unit is called the *mechanical equivalent of heat*, and equals 778 foot-pounds.

In the modern metric or SI system of units, the unit for thermal energy is the *joule* (J); a commonly used multiple being the kilojoule (kJ), or 1000 joules. See page 2520 for an explanation of the SI System. One kilojoule = 0.9478 Btu. Also in the SI System, the *watt* (W), equal to joule per second (J/s), is used for power, where one watt = 3.412 Btu per hour.

Fahrenheit-Celsius (Centigrade) Conversion.—A simple way to convert a Fahrenheit temperature reading into a Celsius temperature reading or vice versa is to enter the accompanying table in the center or boldface column of figures. These figures refer to the temperature in either Fahrenheit or Celsius degrees. If it is desired to convert from Fahrenheit to Celsius degrees, consider the center column as a table of Fahrenheit temperatures and read the corresponding Celsius temperature in the column at the left. If it is desired to convert from Celsius to Fahrenheit degrees, consider the center column as a table of Celsius values, and read the corresponding Fahrenheit temperature on the right.

Interpolation Factors

deg C		deg F		deg C		deg F
0.56	1	1.8		3.33	6	10.8
1.11	2	3.6		3.89	7	12.6
1.67	3	5.4		4.44	8	14.4
2.22	4	7.2		5.00	9	16.2
2.78	5	9.0		5.56	10	18.0

Interpolation factors are given for use with that portion of the table in which the center column advances in increments of 10. To illustrate, suppose it is desired to find the Fahrenheit equivalent of 314 degrees C. The equivalent of 310 degrees C, found in the body of the main table, is seen to be 590.0 degrees F. The Fahrenheit equivalent of a 4-degree C difference is seen to be 7.2, as read in the table of interpolating factors. The answer is the sum or 597.2 degrees F.

Fahrenheit-Celsius (Centigrade) Conversion Table

deg C	deg F	deg C	deg F	deg C	deg F	deg C	deg F

69.4	157	314.6	96.7	206	402.8	337.8	640	1184	2760.0	5000	9032

Above 1000 in the center column, the table increases in increments of 50. To convert 1462 degrees F to Celsius, for instance, add to the Celsius equivalent of 1400 degrees F ten times the interpolation factor for 6 and the interpolation factor for 2 or $760.0 + 33.3 + 1.11$, which equals 794.4.

WEIGHTS AND MEASURES

Measures of Length

1 mile = 1760 yards = 5280 feet

1 yard = 3 feet = 36 inches *1 foot* = 12 inches

1 mil = 0.001 inch

1 fathom = 2 yards = 6 feet *1 rod* = 5.5 yards = 16.5 feet.

1 hand = 4 inches *1 span* = 9 inches

1 micro-inch = one millionth inch or 0.000001 inch (1 micrometer or micron one millionth meter = 0.00003937 inch.)

Surveyor's Measure

1 mile = 8 furlongs = 80 chains

1 furlong = 10 chains = 220 yards

1 chain = 4 rods = 22 yards = 66 feet = 100 links

1 link = 7.92 inches

Nautical Measure

1 league = 3 nautical miles

1 nautical mile = 6076.11549 feet = 1.1508 statute miles

1 knot = nautical unit of speed = 1 nautical mile per hour

One degree at the equator = 60 nautical miles = 69.047 statute miles 360 degrees = 21,600 nautical miles = 24,856.8 statute miles = circumference at equator

Square Measure

1 square mile = 640 acres = 6400 square chains

1 acre = 10 square chains = 4840 square yards = 43,560 square feet. An acre is equal to a square, the side of which is 208.7 feet.

1 square chain = 16 square rods = 484 square yards = 4356 square feet.

1 square rod = 30.25 square yards = 272.25 square feet = 625 square links

1 square yard = 9 square feet

1 square foot = 144 square inches

Measure used for Diameters and Areas of Electric Wires

1 circular inch = area of circle 1 inch in diameter = 0.7854 square inch

1 circular inch = 1,000,000 circular mils

1 square inch = 1.2732 circular inch = 1,273,239 circular mils

1 circular mil = the area of a circle 0.001 inch in diameter

Cubic Measure

1 cubic yard = 27 cubic feet

1 cubic foot = 1728 cubic inches

The following measures are also used for wood and masonry:

1 cord of wood = $4 \times 4 \times 8$ feet = 128 cubic feet

1 perch of masonry = $16\frac{1}{2} \times 1\frac{1}{2} \times 1$ foot = $24\frac{3}{4}$ cubic feet

Shipping Measure

For measuring entire internal capacity of a vessel:

$$1 \text{ register ton} = 100 \text{ cubic feet}$$

For measurement of cargo:

Approximately 40 cubic feet of merchandise is considered a shipping ton, unless that bulk would weigh more than 2000 pounds, in which case the freight charge may be based upon weight

$$40 \text{ cubic feet} = 32.143 \text{ U.S. bushels} = 31.16 \text{ Imperial bushels}$$

Dry Measure

$$1 \text{ bushel} = 1.2445 \text{ cubic feet} = 2150.42 \text{ cubic inches} \\ (\text{U.S. or Winchester struck bushel})$$

$$1 \text{ bushel} = 4 \text{ pecks} = 32 \text{ quarts} = 64 \text{ pints}$$

$$1 \text{ peck} = 8 \text{ quarts} = 16 \text{ pints}$$

$$1 \text{ quart} = 2 \text{ pints}$$

$$1 \text{ heaped bushel} = 1\frac{1}{4} \text{ struck bushel}$$

$$1 \text{ cubic foot} = 0.8036 \text{ struck bushel}$$

$$1 \text{ British Imperial bushel} = 8 \text{ Imperial gallons} = 1.2837 \text{ cubic feet} = 2218.19 \text{ cubic inches}$$

Liquid Measure

$$1 \text{ U.S. gallon} = 0.1337 \text{ cubic foot} = 231 \text{ cubic inches} = 4 \text{ quarts} = 8 \text{ pints}$$

$$1 \text{ quart} = 2 \text{ pints} = 8 \text{ gills} \quad 1 \text{ pint} = 4 \text{ gills}$$

$$1 \text{ British Imperial gallon} = 1.2009 \text{ U.S. gallon} = 277.42 \text{ cubic inches}$$

$$1 \text{ cubic foot} = 7.48 \text{ U.S. gallons}$$

Old Liquid Measure

$$1 \text{ barrel} = 31\frac{1}{2} \text{ gallons} \quad 1 \text{ hogshead} = 2 \text{ barrels} = 63 \text{ gallons}$$

$$1 \text{ pipe or butt} = 2 \text{ hogsheads} = 4 \text{ barrels} = 126 \text{ gallons}$$

$$1 \text{ tierce} = 42 \text{ gallons} \quad 1 \text{ puncheon} = 2 \text{ tierces} = 84 \text{ gallons}$$

$$1 \text{ tun} = 2 \text{ pipes} = 3 \text{ puncheons}$$

Apothecaries' Fluid Measure

$$1 \text{ U.S. fluid ounce} = 8 \text{ drachms} = 1.805 \text{ cubic inch} = \frac{1}{128} \text{ U.S. gallon}$$

$$1 \text{ fluid drachm} = 60 \text{ minims}$$

$$1 \text{ British fluid ounce} = 1.732 \text{ cubic inch}$$

Avoirdupois or Commercial Weight

$$1 \text{ gross or long ton} = 2240 \text{ pounds} \quad 1 \text{ net or short ton} = 2000 \text{ pounds}$$

$$1 \text{ pound} = 16 \text{ ounces} = 7000 \text{ grains}$$

$$1 \text{ ounce} = 16 \text{ drachms} = 437.5 \text{ grains}$$

The following measures for weight are now seldom used in the United States: *1 hundred-weight* = 4 quarters = 112 pounds (*1 gross or long ton* = 20 hundred-weights); *1 quarter* = 28 pounds; *1 stone* = 14 pounds; *1 quintal* = 100 pounds

Troy Weight, used for Weighing Gold and Silver

$$1 \text{ pound} = 12 \text{ ounces} = 5760 \text{ grains}$$

$$1 \text{ ounce} = 20 \text{ pennyweights} = 480 \text{ grains}$$

$$1 \text{ pennyweight} = 24 \text{ grains}$$

$$1 \text{ carat} = 3.086 \text{ grains} \text{ (used in weighing diamonds)}$$

$$1 \text{ grain Troy} = 1 \text{ grain avoirdupois} = 1 \text{ grain apothecaries' weight}$$

Apothecaries' Weight

1 pound = 12 ounces = 5760 grains

1 ounce = 8 drachms = 480 grains

1 drachm = 3 scruples = 60 grains

1 scruple = 20 grains

Measures of Pressure

1 pound per square inch = 144 pounds per square foot = 0.068 atmosphere = 2.042 inches of mercury at 62° F. = 27.7 inches of water at 62° F. = 2.31 feet of water at 62° F.

1 atmosphere = 30 inches of mercury at 62° F. = 14.7 pounds per square inch = 2116.3 pounds per square foot = 33.95 feet of water at 62° F.

1 foot of water at 62° F. = 62.355 pounds per square foot = 0.433 pound per square inch

1 inch of mercury at 62° F. = 1.132 foot of water = 13.58 inches of water = 0.491 pound per square inch

Miscellaneous

1 great gross = 12 gross = 144 dozen

1 quire = 24 sheets

1 gross = 12 dozen = 144 units

1 ream = 20 quires = 480 sheets

1 dozen = 12 units

1 ream printing paper = 500 sheets

1 score = 20 units

METRIC SYSTEMS OF MEASUREMENT

A metric system of measurement was first established in France in the years following the French Revolution, and various systems of metric units have been developed since that time. All metric unit systems are based, at least in part, on the International Metric Standards, which are the meter and kilogram, or decimal multiples or submultiples of these standards.

In 1795, a metric system called the centimeter-gram-second (cgs) system was proposed, and was adopted in France in 1799. In 1873, the British Association for the Advancement of Science recommended the use of the cgs system, and since then it has been widely used in all branches of science throughout the world. From the base units in the cgs system are derived the following:

$$\text{Unit of velocity} = 1 \text{ centimeter per second}$$

$$\text{Acceleration due to gravity (at Paris)} = 981 \text{ centimeters per second per second}$$

$$\text{Unit of force} = 1 \text{ dyne} = \frac{1}{981} \text{ gram}$$

$$\text{Unit of work} = 1 \text{ erg} = 1 \text{ dyne-centimeter}$$

$$\text{Unit of power} = 1 \text{ watt} = 10,000,000 \text{ ergs per second}$$

Another metric system called the MKS (meter-kilogram-second) system of units was proposed by Professor G. Giorgi in 1902. In 1935, the International Electro-technical Commission (IEC) accepted his recommendation that this system of units of mechanics should be linked with the electromagnetic units by the adoption of a fourth base unit. In 1950, the IEC adopted the ampere, the unit of electric current, as the fourth unit, and the MKSA system thus came into being.

A gravitational system of metric units, known as the technical system, is based on the meter, the kilogram as a force, and the second. It has been widely used in engineering. Because the standard of force is defined as the weight of the mass of the standard kilogram, the fundamental unit of force varies due to the difference in gravitational pull at different locations around the earth. By international agreement, a standard value for acceleration due to gravity was chosen (9.81 meters per second squared) that for all practical measurements is approximately the same as the local value at the point of measurement.

The International System of Units (SI).—The Conference Generale des Poids et Mesures (CGPM), which is the body responsible for all international matters concerning the metric system, adopted in 1954, a rationalized and coherent system of units, based on the four MKSA units (see above), and including the *kelvin* as the unit of temperature and the *candela* as the unit of luminous intensity. In 1960, the CGPM formally named this system the *Système International d'Unites*, for which the abbreviation is SI in all languages. In 1971, the 14th CGPM adopted a seventh base unit, the *mole*, which is the unit of quantity ("amount of substance").

In the period since the first metric system was established in France toward the end of the 18th century, most of the countries of the world have adopted a metric system. At the present time, most of the industrially advanced metric-using countries are changing from their traditional metric system to SI. Those countries that are currently changing or considering change from the English system of measurement to metric have the advantage that they can convert directly to the modernized system. The United Kingdom, which can be said to have led the now worldwide move to change from the English system, went straight to SI.

The use of SI units instead of the traditional metric units has little effect on everyday life or trade. The units of linear measurement, mass, volume, and time remain the same, viz. meter, kilogram, liter, and second.

The SI, like the traditional metric system, is based on decimal arithmetic. For each physical quantity, units of different sizes are formed by multiplying or dividing a single base value by powers of 10. Thus, changes can be made very simply by adding zeros or shifting

decimal points. For example, the meter is the basic unit of length; the kilometer is a multiple (1000 meters); and the millimeter is a sub-multiple (one-thousandth of a meter).

In the older metric systems, the simplicity of a series of units linked by powers of ten is an advantage for plain quantities such as length, but this simplicity is lost as soon as more complex units are encountered. For example, in different branches of science and engineering, energy may appear as the erg, the calorie, the kilogram-meter, the liter-atmosphere, or the horsepower-hour. In contrast, the SI provides only one basic unit for each physical quantity, and universality is thus achieved.

As mentioned before, there are seven base units, which are for the basic quantities of length, mass, time, electric current, thermodynamic temperature, amount of substance, and luminous intensity, expressed as the meter (m), the kilogram (kg), the second (s), the ampere (A), the kelvin (K), the mole (mol), and the candela (cd). The units are defined in the accompanying table.

The SI is a coherent system. A system is said to be coherent if the product or quotient of any two unit quantities in the system is the unit of the resultant quantity. For example, in a coherent system in which the foot is the unit of length, the square foot is the unit of area, whereas the acre is not.

Other physical quantities are derived from the base units. For example, the unit of velocity is the meter per second (m/s), which is a combination of the base units of length and time. The unit of acceleration is the meter per second squared (m/s^2). By applying Newton's second law of motion—force is proportional to mass multiplied by acceleration—the unit of force is obtained that is the kilogram-meter per second squared ($kg\cdot m/s^2$). This unit is known as the newton, or N. Work, or force times distance is the kilogram-meter squared per second squared ($kg\cdot m^2/s^2$), which is the joule (1 joule = 1 newton-meter), and energy is also expressed in these terms. The abbreviation for joule is J. Power or work per unit time is the kilogram-meter squared per second cubed ($kg\cdot m^2/s^3$), which is the watt (1 watt = 1 joule per second = 1 newton-meter per second). The abbreviation for watt is W. The term horsepower is not used in the SI and is replaced by the watt, which together with multiples and submultiples—kilowatt and milliwatt, for example—is the same unit as that used in electrical work.

The use of the newton as the unit of force is of particular interest to engineers. In practical work using the English or traditional metric systems of measurements, it is a common practice to apply weight units as force units. Thus, the unit of force in those systems is that force that when applied to unit mass produces an acceleration g rather than unit acceleration. The value of gravitational acceleration g varies around the earth, and thus the weight of a given mass also varies. In an effort to account for this minor error, the kilogram-force and pound-force were introduced, which are defined as the forces due to "standard gravity" acting on bodies of one kilogram or one pound mass, respectively. The standard gravitational acceleration is taken as 9.80665 meters per second squared or 32.174 feet per second squared. The newton is defined as "that force, which when applied to a body having a mass of one kilogram, gives it an acceleration of one meter per second squared." It is independent of g . As a result, the factor g disappears from a wide range of formulas in dynamics. However, in some formulas in statics, where the weight of a body is important rather than its mass, g does appear where it was formerly absent (the weight of a mass of W kilograms is equal to a force of Wg newtons, where g = approximately 9.81 meters per second squared). Details concerning the use of SI units in mechanics calculations are given on page 116 and throughout the Mechanics section in this Handbook. The use of SI units in strength of materials calculations is covered in the section on that subject.

Decimal multiples and sub-multiples of the SI units are formed by means of the prefixes given in the following table, which represent the numerical factors shown.

Factors and Prefixes for Forming Decimal Multiples and Sub-multiples of the SI Units

Factor by which the unit is multiplied	Prefix	Symbol	Factor by which the unit is multiplied	Prefix	Symbol
10^{12}	tera	T	10^{-2}	centi	c
10^9	giga	G	10^{-3}	milli	m
10^6	mega	M	10^{-6}	micro	μ
10^3	kilo	k	10^{-9}	nano	n
10^2	hecto	h	10^{-12}	pico	p
10	deka	da	10^{-15}	femto	f
10^{-1}	deci	d	10^{-18}	atto	a

Standard of Length.—In 1866 the United States, by act of Congress, passed a law making legal the meter, the only measure of length that has been legalized by the United States Government. The United States yard is defined by the relation: 1 yard = $\frac{3600}{3937}$ meter. The legal equivalent of the meter for commercial purposes was fixed as 39.37 inches, by law, in July, 1866, and experience having shown that this value was exact within the error of observation, the United States Office of Standard Weights and Measures was, in 1893, authorized to derive the yard from the meter by the use of this relation. The United States prototype meters Nos. 27 and 21 were received from the International Bureau of Weights and Measures in 1889. Meter No. 27, sealed in its metal case, is preserved in a fireproof vault at the Bureau of Standards.

Comparisons made prior to 1893 indicated that the relation of the yard to the meter, fixed by the Act of 1866, was by chance the exact relation between the international meter and the British imperial yard, within the error of observation. A subsequent comparison made between the standards just mentioned indicates that the legal relation adopted by Congress is in error 0.0001 inch; but, in view of the fact that certain comparisons made by the English Standards Office between the imperial yard and its authentic copies show variations as great if not greater than this, it cannot be said with certainty that there is a difference between the imperial yard of Great Britain and the United States yard derived from the meter. The bronze yard No. 11, which was an exact copy of the British imperial yard both in form and material, had shown changes when compared with the imperial yard in 1876 and 1888, which could not reasonably be said to be entirely due to changes in Bronze No. 11. On the other hand, the new meters represented the most advanced ideas of standards, and it therefore seemed that greater stability as well as higher accuracy would be secured by accepting the international meter as a fundamental standard of length.

For more information on SI practice, the reader is referred to the following publications: *Metric Practice Guide*, published by the American Society for Testing and Materials, 1916 Race St., Philadelphia, PA 19103.

ISO International Standard 1000. This publication covers the rules for use of SI units, their multiples and sub-multiples. It can be obtained from the American National Standards Institute 11 West 42nd Street, New York, NY 10036.

Traditional Metric Measures

Measures of Length

$$10 \text{ millimeters (mm)} = 1 \text{ centimeter (cm)}$$

$$10 \text{ centimeters} = 1 \text{ decimeter (dm)}$$

$$10 \text{ decimeters} = 1 \text{ meter (m)}$$

$$1000 \text{ meters} = 1 \text{ kilometer (km)}$$

Square Measure

*100 square millimeters (mm^2) = 1 square centimeter (cm^2)
 100 square centimeters = 1 square decimeter (dm^2)
 100 square decimeters = 1 square meter (m^2).*

Surveyor's Square Measure

*100 square meters (m^2) = 1 are (a).
 100 acres = 1 hectare (ha).
 100 hectares = 1 square kilometer (km^2).*

Cubic Measure

*1000 cubic millimeters (mm^3) = 1 cubic centimeter (cm^3).
 1000 cubic centimeters = 1 cubic decimeter (dm^3).
 1000 cubic decimeters = 1 cubic meter (m^3).*

Dry and Liquid Measure

*10 milliliters (ml) = 1 centiliter (cl).
 10 centiliters = 1 deciliter (dl).
 10 deciliters = 1 liter (l).
 100 liters = 1 hectoliter (hl).
 1 liter = 1 cubic decimeter = the volume of 1 kilogram of pure water at a temperature of 39.2 degrees F.*

Measures of Weight

*10 milligrams (mg) = 1 centigram (cg).
 10 centigrams = 1 decigram (dg).
 10 decigrams = 1 gram (g).
 10 grams = 1 dekagram (dag).
 10 dekagrams = 1 hectogram (hg).
 10 hectograms = 1 kilogram (kg).
 1000 kilograms = 1 (metric) ton (t).*

Table 1. International System (SI) Units

PHYSICAL QUANTITY	NAME OF UNIT	UNIT SYMBOL	DEFINITION
Basic SI Units			
Length	meter	m	Distance traveled by light in vacuo during $1/299,792,458$ of a second.
Mass	kilogram	kg	Mass of the international prototype which is in the custody of the Bureau International des Poids et Mesures (BIPM) at Sèvres, near Paris.
Time	second	s	The duration of $9,192,631,770$ periods of the radiation corresponding to the transition between the two hyperfine levels of the ground state of the cesium-133 atom.
Electric Current	ampere	A	The constant current which, if maintained in two parallel rectilinear conductors of infinite length, of negligible circular cross section, and placed at a distance of one meter apart in a vacuum, would produce between these conductors a force equal to 2×10^{-7} N/m length.
Thermodynamic Temperature	degree kelvin	K	The fraction $1/273.16$ of the thermodynamic temperature of the triple point of water.
Amount of Substance	mole	mol	The amount of substance of a system which contains as many elementary entities as there are atoms in 0.012 kilogram of carbon 12.
Luminous Intensity	candela	cd	Luminous intensity, in the perpendicular direction, of a surface of $1/600,000$ square meter of a black body at the temperature of freezing platinum under a pressure of 101,325 newtons per square meter.

Table 1. (Continued) International System (SI) Units

PHYSICAL QUANTITY	NAME OF UNIT	UNIT SYMBOL	DEFINITION
SI Units Having Special Names			
Force	newton	N = kg·m/s ²	That force which, when applied to a body having a mass of one kilogram, gives it an acceleration of one meter per second squared.
Work, Energy, Quantity of Heat	joule	J = N·m	The work done when the point of application of a force of one newton is displaced through a distance of one meter in the direction of the force.
Electric Charge	coulomb	C = A·s	The quantity of electricity transported in one second by a current of one ampere.
Electric Potential	volt	V = W/A	The difference of potential between two points of a conducting wire carrying a constant current of one ampere, when the power dissipated between these points is equal to one watt.
Electric Capacitance	farad	F = C/V	The capacitance of a capacitor between the plates of which there appears a difference of potential of one volt when it is charged by a quantity of electricity equal to one coulomb.
Electric Resistance	ohm	$\Omega = V/A$	The resistance between two points of a conductor when a constant difference of potential of one volt, applied between these two points, produces in this conductor a current of one ampere, this conductor not being the source of any electromotive force.
Magnetic Flux	weber	Wb = V s	The flux which, linking a circuit of one turn produces in it an electromotive force of one volt as it is reduced to zero at a uniform rate in one second.
Inductance	henry	H = V s/A	The inductance of a closed circuit in which an electromotive force of one volt is produced when the electric current in the circuit varies uniformly at the rate of one ampere per second.
Luminous Flux	lumen	lm = cd sr	The flux emitted within a unit solid angle of one steradian by a point source having a uniform intensity of one candela.
Illumination	lux	lx = lm/m ²	An illumination of one lumen per square meter.

^aThe figure is exact.

Symbols of SI units, multiples and sub-multiples are given in parentheses in the right-hand column

Metric and English Equivalents

Use of Conversion Tables.—On this and following pages, tables are given that permit conversion from English to metric units and vice versa over a wide range of values. Where the desired value cannot be obtained directly from these tables, a simple addition of two or more values taken directly from the table will suffice as shown in the following examples:

Example 1: Find the millimeter equivalent of 0.4476 inch.

$$\begin{array}{rcccl}
 .4 & \text{in} & = & 10.16000 \text{ mm} \\
 .04 & \text{in} & = & 1.01600 \text{ mm} \\
 .007 & \text{in} & = & .17780 \text{ mm} \\
 \hline
 .0006 & \text{in} & = & .01524 \text{ mm} \\
 \hline
 .4476 & \text{in} & = & 11.36904 \text{ mm}
 \end{array}$$

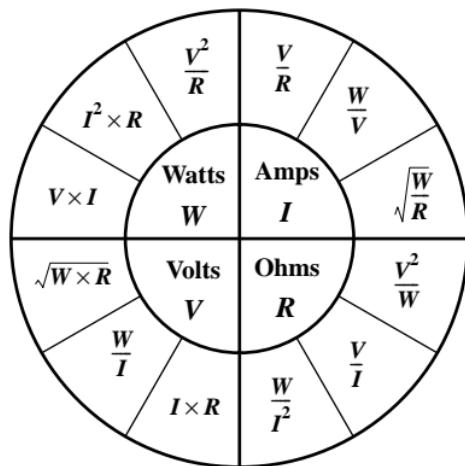

Example 2: Find the inch equivalent of 84.9 mm.

$$\begin{array}{rcccl}
 80. & \text{mm} & = & 3.14961 \text{ in.} \\
 4. & \text{mm} & = & 0.15748 \text{ in.} \\
 \hline
 0.9 & \text{mm} & = & 0.03543 \text{ in.} \\
 \hline
 84.9 & \text{mm} & = & 3.34252 \text{ in.}
 \end{array}$$

square mils	1.273	circular mils

Ohm's Law.—The following figure represents basic electrical relationships. This chart has been formatted in such a way that each variable has been related to the other three variables. This figure is simply for reference.

Key to variables:
 V = Voltage (Volts)
 R = Resistance (Ohms)
 I = Current (Amps)
 W = Power (Watts)

Circular Model of Electrical Relations

Binary Multiples.—The International Electrotechnical Commission has assigned the following prefixes to represent exponential binary multiples. This avoids confusion with standard SI decimal prefixes when representing powers of 2, as in bits and bytes.

Symbol	Name	Binary Power	Symbol	Name	Binary Power
Ki	kibi	2^{10}	Ti	tebi	2^{40}
Mi	mebi	2^{20}	Pi	pebi	2^{50}
Gi	gibi	2^{30}	Ei	exbi	2^{60}

Example 1: $2 \text{ Ki} = 2 \times 2^{10} = 2 \times 1,024 = 2,048$. This does not equal $2 \text{ K} = 2 \times 10^3 = 2,000$.

Example 2: $1 \text{ mebibyte} = 1 \times 2^{20} = 1,048,576$ bytes. Again this does not equal $1 \text{ megabyte} = 1 \times 10^6 = 1,000,000$ bytes, a value that is often confused with 1,048,576 bytes.

Linear Measure

1 kilometer = 0.6214 mile

1 meter = 39.37 inches = 3.2808 feet = 1.0936 yards

1 centimeter = 0.3937 inch

1 millimeter = 0.03937 inch

1 mile = 1.609 kilometers

1 yard = 0.9144 meter

1 foot = 0.3048 meter = 304.8 millimeters

1 inch = 2.54 centimeters = 25.4 millimeters

For inches to centimeters, shift decimal point in mm column one place to left and read centimeters, thus:

$$40 \text{ in.} = 1016 \text{ mm} = 101.6 \text{ cm}$$

For centimeters to inches, shift decimal point of centimeter value one place to right and enter mm column, thus:

$$70 \text{ cm} = 700 \text{ mm} = 27.55906 \text{ inches}$$

Decimals of an Inch to Millimeters
 (Based on 1 inch = 25.4 millimeters, exactly)

900	274,320	90	27,432	9	2,743.2	0.9	274.32
1,000	304,800	100	30,480	10	3,048.0	1.0	304.80

Example 1: Find millimeter equivalent of 293 feet, $5\frac{7}{64}$ inches.

200 ft	=	60,960.	mm
90 ft	=	27,432.	mm
3 ft	=	914.4	mm
5 in.	=	127.0	mm
$\frac{47}{64}$ in.	=	18.653	mm
293 ft $5\frac{7}{64}$ in.	=	89,452.053	mm

Example 2: Find millimeter equivalent of 71.86 feet.

70.	ft	=	21,336.	mm
1.	ft	=	304.8	mm
.80	ft	=	243.84	mm
.06	ft	=	18.288	mm
71.86	ft	=	21,902.928	mm

The following short table permits conversion of microinches to micrometers for ranges higher than in the main table given above. Appropriate quantities chosen from both tables are simply added to obtain the higher converted value:

μin.	μm	μin.	μm	μin.	μm	μin.	μm	μin.	μm
300	7.620	900	22.860	1500	38.100	2100	53.340	2700	68.580
600	15.240	1200	30.480	1800	45.720	2400	60.960	3000	76.200
<i>Example:</i> Convert 1375 μin. to μm:									
From above table:	1200 μin.	=	30.480 μm						
From main table:	175 μin.	=	4.445 μm						
	1375 μin.	=	34.925 μm						

Micrometers (microns) to Microinches
(Based on 1 microinch = 0.0254 micrometers, exactly)

The table given below can be used with the preceding main table to obtain higher converted values, simply by adding appropriate quantities chosen from each table:

μm	μin.	μm	μin.	μm	μin.	μm	μin.	μm	μin.
10	393.7	20	787.4	30	1,181.1	40	1,574.8	50	1,968.5
15	590.6	25	984.3	35	1,378.0	45	1,771.7	55	2,165.4
<i>Example:</i> Convert 23.55 μm to μin.:									
From above table:	20.00 μm	=	787.4 μin.						
From main table:	3.55 μm	=	139.8 μin.						
	23.55 μm	=	927.2 μin.

Square Measure

1 square kilometer = 0.3861 square mile = 247.1 acres

1 hectare = 2.471 acres = 107,639 square feet

1 are = 0.0247 acre = 1076.4 square feet

1 square meter = 10.764 square feet = 1.196 square yards

1 square centimeter = 0.155 square inch

1 square millimeter = 0.00155 square inch

1 square mile = 2.5899 square kilometers

1 acre = 0.4047 hectare = 40.47 acres

1 square yard = 0.836 square meter

1 square foot = 0.0929 square meter = 929 square centimeters

1 square inch = 6.452 square centimeters = 645.2 square millimeters

Cubic Measure

1 cubic meter = 35.315 cubic feet = 1.308 cubic yards.

1 cubic meter = 264.2 U.S. gallons.

1 cubic centimeter = 0.061 cubic inch.

1 liter (cubic decimeter) = 0.0353 cubic foot = 61.023 cubic inches.

1 liter = 0.2642 U.S. gallon = 1.0567 U.S. quarts.

1 cubic yard = 0.7646 cubic meter.

1 cubic foot = 0.02832 cubic meter = 28.317 liters.

1 cubic inch = 16.38706 cubic centimeters.

1 U.S. gallon = 3.785 liters.

1 U.S. quart = 0.946 liter.

Power and Heat Equivalents

1 horsepower-hour = 0.746 kilowatt-hour = 1,980,000 foot-pounds = 2545 Btu
(British thermal units) = 2.64 pounds of water evaporated
at 212°F = 17 pounds of water raised from 62° to 212°F.

1 kilowatt-hour = 100 watt-hours = 1.34 horsepower-hour = 2,655,200 foot-pounds = 3,600,000 joules = 3415 Btu = 3.54 pounds of water evaporated at 212°F = 22.8 pounds of water raised from 62° to 212°F.

1 horsepower = 746 watts = 0.746 kilowatt = 33,000 foot-pounds per minute = 550 foot-pounds per second = 2545 Btu per hour = 42.4 Btu per minute = 0.71 Btu per second = 2.64 lbs. of water evaporated per hour at 212°F.

1 kilowatt = 1000 watts = 1.34 horsepower = 2,654,200 foot-pounds per hour = 44,200 foot-pounds per minute = 737 foot-pounds per second = 3415 Btu per hour = 57 Btu per minute = 0.95 Btu per second = 3.54 pounds of water evaporated per hour at 212°F.

1 watt = 1 joule per second = 0.00134 horsepower = 0.001 kilowatt = 3.42 Btu per hour = 44.22 foot-pounds per minute = 0.74 foot-pounds per second = 0.0035 pound of water evaporated per hour at 212°F.

1 Btu (British thermal unit) = 1052 watt-seconds = 778 foot-pounds = 0.252 kilogram-calorie = 0.000292 kilowatt-hour = 0.000393, horsepower-hour = 0.00104 pound of water evaporated at 212°F.

1 foot-pound = 1.36 joules = 0.000000377 kilowatt-hour = 0.00129 Btu = 0.0000005 horsepower-hour.

1 joule = 1 watt-second = 0.00000078 kilowatt-hour = 0.00095 Btu = 0.74 foot-pound.

Counter electromotive force	cemf		
Cubic	cu	High pressure	hp
Cubic centimeter	cm^3 or cc	Horsepower	hp
Cubic foot	ft^3 or cu ft	Horsepower-hour	hp hr
Cubic feet per second	ft^3 or cfs	Hour	h or hr
Cubic inch	in^3 or cu in	Hyperbolic cosine	cosh
Cubic meter	m^3 or cu m	Hyperbolic sine	sinh
Cubic millimeter	mm^3 or cumm	Hyperbolic tangent	tanh
Cubic yard	yd^3 or cu yd	pound-force foot	$lb_f \cdot ft$ or lb ft
Current density	cd	pound-force inch	$lb_f \cdot in$ or lb in
Cylinder	cyl	Inch	in
Indicated horsepower-hour	iph	Inch per second	in/s or ips

**American National Standard Abbreviations for Scientific and Engineering Terms
ANSI Y1.1-1972, (R 1984) (Continued)**

Intermediate pressure	ip	Inch-pound	in lb
Internal	intl	pound-force per square foot	lb/ ft^2 or psf
Kilovolt-ampere/hour	KVA-h or kVah	pound-force per square inch	lb/in 2 or psi
Kilowatt-hour meter	kwhm	pound per horsepower	lb/hp or php
Latitude	lat	Power factor	pf
Least common multiple	lcm	Quart	qt
Liquid	liq	Reactive volt-ampere meter	rva
Logarithm (common)	log	Revolution per minute	r/min or rpm
Logarithm (natural)	ln	Revolution per second	r/s or rps
Low pressure	lp	Root mean square	rms
Lumen per watt	lm/W or lpw	Round	rnd
Magnetomotive force	mmf	Secant	sec
Mathematics (ical)	math	Second	s or sec
Maximum	max	Sine	sin
Mean effective pressure	mep	Specific gravity	sp gr
Melting point	mp	Specific heat	sp ht
Meter	m	Square	sq
Meter-kilogram-second	mks	Square centimeter	cm 2 or sq cm
Microfarad	μF	Square foot	ft 2 or sq ft
Mile	mi	Square inch	in 2 or sq in
Mile per hour	mi/h or mph	Square kilometer	km 2 or sq km
Milliampere	m/A	Square root of mean square	rms
Minimum	min	Standard	std
Molecular weight	mol wt	Tangent	tan
Molecule	mo	Temperature	temp
National Electrical Code	NEC	Tensile strength	ts
Ounce	oz	Versed sine	vers
Ounce-inch	oz in	Volt	V
Pennyweight	dwt	Watt	W
Pint	pt	Watthour	Wh
Potential	pot	Week	wk
Potential difference	pd	Weight	wt
Pound	lb	Yard	yd

Alternative abbreviations conforming to the practice of the International Electrotechnical Commission.

Ampere	A	Kilovolt-ampere	kVA	Microfarad	μF	Milliampere	mA
Ampere-hour	Ah	Kilowatt	kW	Microwatt	μW	Volt	V
Coulomb	C			Milliampere	mA	Volt-ampere	VA
Farad	F	Kilowatthour	kWh	Millifarad	mF	Volt-coulomb	VC
Henry	H	Megawatt	MW	Millihenry	mH	Watt	W
Joule	J	Megohm	M Ω	Millivolt	mV	Watthour	Wh
Kilovolt	kV	Microampere	μA	Ohm	ω	Volt	VA

Only the most commonly used terms have been included. These forms are recommended for those whose familiarity with the terms used makes possible a maximum of abbreviations. For others, less contracted combinations made up from this list may be used. For example, the list gives the abbreviation of the term "feet per second" as "fps." To some, however, ft per sec will be more easily understood.

Abbreviations should be used sparingly and only where their meaning will be clear. If there is any doubt, then spell out the term or unit of measurement.

The following points are good practice when preparing engineering documentation. Terms denoting units of measurement should be abbreviated in text only when preceded by the amounts indicated in numerals: "several inches," "one inch," "12 in." A sentence should not begin with a numeral followed by an abbreviation. The use of conventional signs for abbreviations in text should be avoided: use "lb," not "#" or "in," not".

Symbols for the chemical elements are listed in the table on page 363.
